Preface xi

Introduction. The Stern-Gerlach Experiment 1

Part I The Structure of Quantum Theory

1 Vector Spaces 11

- Vectors 12
- Operators 14
- Eigenvectors and Eigenvalues 21
- Inner Products of Vectors in \mathbb{R}^2 26
- Complex Numbers 28
- The Space \mathbb{C}^2 31
- The Pauli Spin Matrices 36
- Mathematical Generalization 38
- Vector Spaces 40
- Linear Operators 42
- Inner Products on \mathcal{V} 43
- Subspaces and Projection Operators 45
- Orthonormal Bases 48
- Operators with a Discrete Spectrum 49
- Operators with a Continuous Spectrum 51
- Hilbert Spaces 55

2 States and Observables in Quantum Mechanics 57

- Classical Mechanics: Systems and Their States 57
- Observables and Experimental Questions 59
- States and Observables in Quantum Theory 63
- Probabilities and Expectation Values 70
- The Evolution of States in Classical Mechanics 72
- Determinism 74
- The Evolution of States in Quantum Mechanics 77
- Theories and Models 79

- 3 *Physical Theory and Hilbert Spaces* 83
Minimal Assumptions for Physical Theory 85
The Representation of Outcomes and Events 86
The Representation of States 88
Determinism, Indeterminism, and the Principle of Superposition 91
Mixed States 93
Observables and Operators 97
Relations between Observables: Functional Dependence and Compatibility 99
Incompatible Observables 104
The Representational Capacity of Hilbert Spaces 107
The Schrödinger Equation 113
- 4 *Spin and Its Representation* 119
Symmetry Conditions and Spin States 120
A Partial Representation of Spin in \mathbb{R}^2 123
The Representation of $\{S_\alpha\}$ in \mathbb{C}^2 127
Conclusion 131
- 5 *Density Operators and Tensor-Product Spaces* 136
Operators of the Trace Class 136
Density Operators 138
Density Operators on \mathbb{C}^2 139
Pure and Mixed States 141
The Dynamical Evolution of States 145
Gleason's Theorem 146
Composite Systems and Tensor-Product Spaces 148
The Reduction of States of Composite Systems 149

Part II The Interpretation of Quantum Theory

- 6 *The Problem of Properties* 155
Properties, Experimental Questions, and the Dispersion Principle 155
The EPR Argument 158
Bohm's Version of the EPR Experiment 159
The Statistical Interpretation 162
Kochen and Specker's Example 164
Generalizing the Problem 168
The Bell-Wigner Inequality 170
Hidden Variables 172
Interpreting Quantum Theory: Statistical States and Value States 175
- 7 *Quantum Logic* 178
The Algebra of Properties of a Simple Classical System 178
Boolean Algebras 182
Posets and Lattices 186
The Structure of $S(\mathcal{H})$ 190
The Algebra of Events 194
A Formal Approach to Quantum Logic 201

	An Unexceptionable Interpretation of Quantum Logic	207
	Putnam on Quantum Logic	209
	Properties and Deviant Logic	212
8	<i>Probability, Causality, and Explanation</i>	218
	Probability Generalized	219
	Two Uniqueness Results	220
	The Two-Slit Experiment: Waves and Particles	226
	The Two-Slit Experiment: Conditional Probabilities	232
	The Bell-Wigner Inequality and Classical Probability	237
	Bell Inequalities and Einstein-Locality	238
	Bell Inequalities and Causality	245
	Coupled Systems and Conditional Probabilities	248
	Probability, Causality, and Explanation	255
9	<i>Measurement</i>	259
	Three Principles of Limitation	259
	Indeterminacy and Measurement	265
	Projection Postulates	271
	Measurement and Conditionalization	275
	The Measurement Problem and Schrödinger's Cat	278
	Jauch's Model of the Measurement Process	281
	A Problem for Internal Accounts of Measurement	284
	Three Accounts of Measurement	288
10	<i>An Interpretation of Quantum Theory</i>	296
	Abstraction and Interpretation	296
	Properties and Latencies: The Quantum Event Interpretation	301
	The Copenhagen Interpretation	306
	The Priority of the Classical World	310
	Quantum Theory and the Classical Horizon	312
	Appendix A. Gleason's Theorem	321
	Appendix B. The Lüders Rule	347
	Appendix C. Coupled Systems and Conditionalization	349
	References	351
	Index	363
