PREFACE	<i>page xi</i>
1 The paradox of addiction	1
1.1 Addictions provide a model for participatory disease	3
1.2 Behavioral science has not dealt with our most significant decisions	7
1.2.1 Utilitarian concepts of higher motives are primitive	8
1.2.2 Anomalies contradict current utility theory	12
1.3 Utility theory fails to account for several major areas of behavior	14
1.3.1 Ambivalence	14
1.3.2 Participation in aversion	17
1.3.3 Dependence of rewards on taste	19
1.3.4 Need for emotional objects	21
2 In search of the two minds	24
2.1 Conflict with other people does not imply ambivalence	25
2.2 Multiple centers of choice must compete on a common basis	28
2.3 Separate principles of decision making must also compete	32
2.3.1 Motivated lower principles	33
2.3.2 Unmotivated lower principles	39
2.4 Misinformation cannot cause ambivalence	48
2.4.1 Superstition	48
2.4.2 Hidden costs	49
2.4.3 Misinterpretation	50
2.4.4 Nonspecific errors of learning	51

2.4.5	Errors in logic	51
2.4.6	Logical errors under pressure	52
2.5	Most models incidentally imply that delayed events are devalued	53
3	Temporary-preference theory	56
3.1	Temporal distortion is a simple mechanism for ambivalence	56
3.2	There is an innate tendency to devalue future events	56
3.3	Discount curves must cross to produce ambivalence	60
3.4	Herrnstein's matching law describes discounting with a hyperbola	63
3.4.1	Fine-tuning the matching law	67
3.5	Temporary preference can be observed directly	76
3.6	Hyperbolic discounting seems counterintuitive	80
3.7	Matching may be more adaptive than maximizing	85
3.8	The parties to intrapsychic conflicts resemble political interests	88
3.9	Summary	95
4	The interaction of interests: The effects of short-range interests	96
4.1	The duration of a temporary preference determines its nature	96
4.1.1	Addictions	97
4.1.2	Sellouts	98
4.1.3	Itches	99
4.1.4	Pains	100
4.2	Pain is an intense, very brief, rapidly recurring reward that undermines other rewards	101
4.2.1	Two-factor theory	102
4.2.2	One-factor theory: Pain as nonreward	105
4.2.3	An alternative one-factor theory: Pain as a reward–nonreward sequence	109
4.3	Interests interact according to their durations	114
4.3.1	“Higher” interests	116
4.3.2	The constitution of short-range interests	117
4.3.3	Impulses as a chain of predation	119

5	The interaction of interests	123
5.1	A direct increase in an organism's valuation of the future is unlikely	123
5.2	Consistent choice requires precommitment	125
5.2.1	Some authors have described simple precommitments	126
5.2.2	Freud's defense mechanisms confound precommitment and its evasion	128
5.3	There are four ways to precommit future behaviors	130
5.3.1	Extrapsychic mechanisms	130
5.3.2	Control of attention	133
5.3.3	Preparation of emotion	135
5.3.4	Personal rules	142
5.4	Hyperbolic discount functions predict personal rules	144
5.5	Personal rules solve a bargaining problem	155
5.6	The properties of a personal rule depend on the set of choices it covers	162
5.6.1	Redefining personal rules: The role of bright lines	163
5.6.2	Behavioral research on the perception of precedents	171
5.7	Precommitting methods interact	174
5.8	The selection of behaviors is different from the selection of organisms	179
6	Freedom and compulsion	185
6.1	Freud's energy theory can be revised in motivational terms	185
6.1.1	Defense mechanisms vary in their usefulness as precommitments	190
6.2	Personal rules transform the nature of choice	192
6.2.1	Impulses exist simultaneously with their controls	193
6.2.2	Failures of will lead to "vice districts"	193
6.2.3	The internal marketplace is no longer free	197
6.3	Prediction of one's future choices tends to be self-confirming	200

viii CONTENTS

6.4	Complusiveness is a side effect of personal rules	205
6.4.1	Even compulsive people may be unable to report their rules	208
6.4.2	How a rule becomes a compulsion	211
6.4.3	Ordinary coercion by rules is experienced as conscience	213
6.4.4	Personal rules may serve midrange interests	216
6.4.5	Excessive coercion is attributed to outside forces	225
7	Self-generated reward as the basic impulse-control problem	228
7.1	The consistent value of money depends on personal rules	228
7.1.1	The artificiality of spending decisions	236
7.2	Rules to prevent vacillation are seen in "cognitive dissonance"	242
7.3	Most rewards are not limited by environmental events	243
7.3.1	Tastes and appetites	244
7.3.2	The perils of self-reward	249
7.4	Devices that limit self-reward will be valuable	256
7.4.1	Surprise as the ultimate shield against wasteful self-reward	259
7.4.2	Premature satiation spoils the direct path to some rewards	262
7.5	Even physiological rewards may operate by pacing self-reward	263
7.5.1	A mechanism for concrete reward	266
7.5.2	How the prospect of concrete rewards governs appetites for them	269
7.6	The self-reward hypothesis accounts for the imperceptibility of the stimuli necessary for reward	271
8	The demon at the calliope	274
8.1	A mechanical model demonstrates the limits of self-reward	274
8.1.1	Summary using the calliope illustration	284
8.1.2	Illustrations using the calliope model	286
8.1.3	Precommitments open to the demon	288

8.2	The crucial properties of pacing devices are aesthetic	291
8.2.1	Optimal rarity	293
8.3	The main value of other people is to pace one's own self-reward	296
8.4	The need to pace self-reward determines the equilibrium of fantasy and reality	300
8.4.1	Belief is an application of will	303
8.4.2	Leaps of faith are based on personal rules	305
8.4.3	Hedges on testing reality	308
8.4.4	The projective experience of belief	311
8.5	Fantasy illustrates the role of reality	313
8.6	The testing of future realities is easily hedged	315
8.7	Rules for testing reality lead to some of the common emotions	319
8.7.1	Hope	320
8.7.2	Regret	321
8.7.3	Guilt	322
8.7.4	Envy	323
8.7.5	A converse of regret	323
8.7.6	The lure of false hope	323
8.7.7	Mirth	324
8.8	Summary	327
9	The texture of experience	328
9.1	The "self" is a community of interests	328
9.2	The ego's job is to budget future motivation	331
9.2.1	Finding reward	332
9.2.2	Budgeting reward	333
9.3	Interests evolve over time	334
9.3.1	Factors that increase the rigidity of rules	335
9.3.2	Factors that decrease the productivity of rules	339
9.4	The evolution of rules affects the optimal budgeting of rewards	350
9.4.1	Letting impulses satiate	350
9.4.2	Finding durable pacing devices	351
9.4.3	Avoiding overly concrete rules	353
9.5	Internal bargaining interacts with external	355
9.5.1	The voluntary/involuntary dichotomy	356

X CONTENTS

9.5.2	The unity of the self	359
9.6	Psychological conclusions: The individual is a population of bargaining interests	360
9.7	Economic conclusions: Surprise is different from other goods	363
9.8	Social conclusions: The pathology of leisure differs from that of scarcity	365
