CHAPTER I

	PAGE
PHILOSOPHY AND THE AVERAGE THOUGHTFUL MAN .	1

The experiment of living without philosophy. The sporting theory of philosophy. Popular impressions of the history of thought. The layman's interest in great questions. Philosophy inevitable when life reaches the reflective stage of development. Looking down the long vistas of evolution. Why religion cannot dispense with the service of the intellect. Great thought and noble feeling go together. Apropos of Bergson. His reserve. Philosophizing in Bergsonian fashion.

CHAPTER II

CREATIVE EVOLUTION IN REAL TIME	19
---	----

The nature of human progress. Its locus the spiritual traditions of the race. How thought climbs through the ages. Bergson a new star in the intellectual firmament. The present thought situation. Materialism and idealism have led us into an *impasse*. Our hope of an adequate philosophy lies in a thorough-going evolutionism. Around Kant to the great highway of human thought.

CHAPTER III

THE CONCEPTION OF THE LIFE FORCE	35
--	----

Our inheritance from two different civilizations. Hebraic ideas. The Greek conception of creation as the introduction of order into chaos. The Spencerian agnosticism. Kant's position. Schopenhauer and the World Will. Effect of

CONTENTS

PAGE

his mixed temperament on his philosophy. He just misses the highest conception. The philosophy of Buddhism, of Christianity. Browning's theme. Bergson's conception of the Life Force.

CHAPTER IV

OUTLINE OF THE BERGSONIAN WORLD-VIEW . . . 50

Why philosophy begins with, or at least includes, a theory of knowledge. Bergson's theory of the intellect as an instrument evolved for practical but not for speculative purposes. It can know the very truth of matter, but not of life. The nature of conceptual thought. The thought-frames molded on the material world do not fit the processes of life. The universe not a mechanism, but a life that endures through real time. In the beginning was life. Man the great success in life's adventure.

CHAPTER V

INSTINCT, INTELLECT AND THE IDEALLY COMPLETE MIND 64

Instinct and intellect complementary, not different degrees of the same power. Instinct may be developed into intuition. Through it alone we may attain to insight into life. Philosophy helps us to live by combining into one world-view the scientific knowledge which the intellect gives with the truth concerning life which comes through intuition. Bergson's unique theory of perception. He is no relativist, idealist or pragmatist. Pragmatism no solution of the great problems: it is rather the pragmatic habit of mind that has created them.

CHAPTER VI

BERGSON AND PHYSICAL SCIENCE 77

Why a new era in philosophy may date from Bergson. Descartes and Kant cherish the mathematical ideal of knowledge. Bergson the first thinker of his class to take into ac-

CONTENTS

PAGE

count the data of biology. Our native tendency to Platonism. Thinking as classifying. What happens when we have an insufficient number of classes. Nature of mathematical knowledge. It is not knowledge of nature, but deals with pure ideals. It is a set of consistencies with a certain applicability in the concrete world. Physical science deals with artificially isolated systems in a concrete whole which is not a system, a mechanism, but a life. Why metaphysics must be empirical.

CHAPTER VII

THE ANSWER OF THE MECHANISTS 89

Sir Ray Lancaster speaks for the materialists in science. His attitude to philosophy and his criticism of Bergson. The eye of the Pecten. Huxley's theory that we are conscious automata. The average man's interest in the issues involved. Evils of unconscious metaphysics. Logical outcome of the automaton theory. The individuality of life. It does not fit into systems. School systems. Injustice of all classifications of living men. Tolstoy's perception of this fact.

CHAPTER VIII

LIGHT FROM BERGSON'S THEORY OF KNOWLEDGE UPON BIOLOGICAL PROBLEMS 107

The puzzles of evolution. Failure of attempts at mechanical explanation. Darwin's theory of the accumulation of insensible variations. Insuperable difficulties. The eye of the Pecten. Heteroblastia. The mutation theory. Bergson points the way to a solution. Our baseless assumption that nature builds organic structures after the manner of a manufacturer. The difficulty is due to the nature of our minds, or rather to our intellectual bias, and lies in our mistaken conception of what constitutes an explanation in the problems of

CONTENTS

PAGE

life. Why the painter easily accomplishes what is impossible to the worker in mosaic. The life impulse. This does not imply the old vitalism.

CHAPTER IX

SOME CONSEQUENCES FOR PRACTICAL LIFE AND THE PHILOSOPHY OF RELIGION 123

The great lines of evolution. The many interwoven personalities. Danger of automatism. T. Davidson on habit. Constant perplexity a condition of consciousness. The intellect a "trouble man." The vegetative, instinctive and rational life three divergent directions of an activity that split up as it grew. Consequences for pedagogy, for practical life, for religion. Instinct, developed into intuition, knows life because it is life, because instinctive processes are only a prolongation of organic processes. This not mysticism. For Kant all intuition is infra-intellectual. Bergson's contention that there is also a supra-intellectual intuition.

CHAPTER X

THE PRAGMATIC VIEW OF SCIENCE AND COMMON SENSE AND THE SYNOPTIC VIEW OF PHILOSOPHY . 139

The chief difficulty in understanding "Creative Evolution" is that we are *too intellectual*. How our fixed habits of thought interfere even with our perceptions. The material world for practical purposes is a collection of objects; really it is a flux. Is matter disintegrating? The phenomena of radio-activity. Futility of efforts to think the living in terms of the lifeless. Zeno's arrow. Achilles and the tortoise. Natural inability of the intellect to comprehend life. This not anti-intellectualism. The synoptic view of philosophy.

CHAPTER XI

BERGSON AND ETHICS 161

Elevation and completeness of Greek ethical thought. Plato's conception of the good life.

CONTENTS

PAGE

For him the moral problem was a problem in organization. Urgent need to-day of a revised conception of goodness. Beauty and defects of the New Testament teaching. The two great fundamental ideas of organization and evolution round out ethical philosophy. Bergsonian ethics. His ideal the freedom, alertness, and adaptability which ever meets new situations with appropriate adjustments. Social function of laughter. No finalities. Keep life growing. *Es lebe das Leben.*

CHAPTER XII

BERGSON AND PRAGMATISM 179

Logical and historical relation of Bergson to his predecessors, especially to Schopenhauer and Schelling. Popular interest in Idealism and Pragmatism. The present situation according to Professors Perry and Pratt. The original pragmatism of C. S. Peirce and its numerous transformations. Pragmatism as a method of determining significant propositions, as a theory of truth, a theory of knowledge, a theory of reality. Net outcome of the controversy. Bergson no pragmatist in his theory of knowledge. For him the intellect is an instrument for practical purposes, yet it knows the truth of matter. In another way, we also know the truth of life. In what sense is he an anti-intellectualist?

CHAPTER XIII

THE RELIGIOUS SIGNIFICANCE OF BERGSON'S CONCEPTION OF EVOLUTION 225

The enduring supremacy of the moral and religious interests. Religion involves a teleological conception of the world. Tolstoy on the clue to history. Interpreting the evolutionary process by its outcome. Bergson rejects teleology, yet qualifies his view. Finalistic conceptions, like the mechanistic, seem to him too rigid to fit the free, flowing, incalculable, adventurous nature of life. He finds a meaning in

CONTENTS

PAGE

life. Can there be meaning without purpose? Teleology implied in such terms as "Creative Evolution," meaning, progress, effort.

CHAPTER XIV

BERGSON AND RELIGION (*Continued*) 246

No help in half-way modes of thought. Naturalism consistently carried out is transfigured and becomes a religious philosophy. Man as the outcome of evolution. Views of Professor Henry Jones, F. J. E. Woodbridge and L. P. Jacks. The great difficulty in the way of this interpretation. How Bergson meets it. Sense in which he regards "humanity as the ground of evolution." Development along many lines, yet man has kept "the fundamental direction of life."

CHAPTER XV

BERGSON AND RELIGION (*Concluded*) 269

Value of such an interpretation of evolution for religious thought and life. Bergson's critics. The question of purpose in human life and in the cosmical élan. Bergson offers a method, and not the solution of all the great problems. The intuitive method in art and philosophy. Use of it by the great poets. Browning and Wordsworth confirm his vision, but they see deeper and go further. Poetry and philosophy come together on the heights.
