BOOK I

PRELIMINARY CONSIDERATIONS

Argument of Book I	•	•	•	•	•	•	•		1
--------------------	---	---	---	---	---	---	---	--	---

CHAPTER I

McTAGGART'S METHOD AND ITS RELATIONS TO OTHER METHODS

3-9	I. METHOD AND AIM OF MCTAGGART'S ENQUIRY .
3	The object is (A) to discover what characteristics be- long (a) distributively, or (b) collectively, to all that exists
4	And (B) to derive from the conclusions of (A) consequences about empirically known existents. This has three divisions, viz.
4 5	(a) to show that certain apparent characteristics are delusive, (b) to explain how such delusions are pos- sible, and (c) on this basis to conjecture the real nature of the existent
45 5	The method in (A) is wholly a priori, except for two empirical premises
5-6	An empirical premise may be an object of knowledge, and the privacy of its subject is no objection for McTaggart's purpose
6–7	The introduction of the Principle of Determining Correspondence, as the only way of avoiding a cer- tain alleged contradiction, is a characteristic feature of McTaggart's method
7-8	Analogies and differences between this procedure and that of Leibniz and Spinoza
	Complete certainty is claimed for the results of (A) and (B, a) ; for those of (B, b) and (B, c) only high
8	probability

CONTENTS	ix
2·1. Does anything exist?	page 22-23
McTaggart holds that we know empirically that something does in fact exist, but that we do not know <i>a priori</i> that there must be existents	22
McTaggart's argument uses a suppressed premise, but the premise is quite certain	22-23
It is not clear whether McTaggart held that the fact that there are existents can be seen to be contingent or only that it cannot be seen to be necessary.	23

CHAPTER III

IS EXISTENCE CO-EXTENSIVE WITH REALITY? (I) CHARACTERISTICS AND POSSIBILITIES

McTaggart holds that anything that was a particular, or that directly or indirectly characterised a particular, would be existent	24
There seem <i>prima facie</i> to be terms which are not existents, viz., non-characterising characteristics, possibilities, and propositions. Are there such	
terms? And, if so, are they not existents? .	24 - 25
1. Non-characterising Characteristics	25-53
1.1. McTaggart's View	25-29
McTaggart distinguishes between the characteristics of actual particulars and characteristics in general. The latter would not be existents	25
The distinction as drawn by McTaggart seems up-	
tenable	25-26
He seems to have mistaken an epistemological distinc- tion between two ways of describing a characteristic for an ontological distinction between characteristics themselves	26-27
McTaggart's argument to show that there are no non- existent characteristics. It assumes that every part of an existent must be an existent	27
Criticism and restatement of the argument	27-28
The word "part" is so ambiguous that no weight can be attached to McTaggart's premise	28
His argument depends on so widening the criterion of	-0
existence that the conclusion is wholly trivial	28-29

Definition of "Empirical Concents"	page 40
	41-42
Definition of "a priori Concepts"	42
*1.221. Concepts of Ideal Limits	42 - 45
Concepts of Ideal Limits are either compound em- pirical concepts of a certain kind or ideas of super- latives	42
Some comparatives do, and some do not, involve the notion of a superlative	4243
The idea of a perfectly straight object might be the idea of an object than which it is logically impossible for anything to be straighter	43-44
The notion of "straighter" is an empirical concept; the knowledge that this comparative has a super-	
$a \ priori$	44
*1.222. Concepts of Categories	45-46
Two analyses of causal propositions which would make the concept of Causation empirical. Neither seems satisfactory	45
It is nossible but by no means portain that the con-	10
cept of Causation is a priori	46
*1.223. Concepts of Ethical Characteristics	46-47
Unless a purely naturalistic analysis of ethical pro- positions be possible, the concepts of ethical cha-	
racteristics are almost certainly a priori	46-47
*1.23. Positive Theories of a priori Concepts	47-53
Two theories are possible, viz., that of Innate Ideas and that of Non-perceptual Intuition	47
*1.231. Theory of Innate Ideas	47-51
The theory must take the form that there are innate dispositions to form certain dispositional ideas	48
Statement of the theory	48-49
In this form it can meet all the usual objections, and	
it may well be true	49-51
*1.232. Theory of Non-perceptual Intuition The innateness of an idea would not guarantee its	51–53
validity	51

CHAPTER IV

IS EXISTENCE CO-EXTENSIVE WITH REALITY? (II) PROPOSITIONS

Summary of McTaggart's statements about proposi- tions. He does not define the term "Proposition"	56
McTaggart's definition of "Facts". He makes state- ments which are inconsistent with it	57
What are "Propositions", and why are there supposed to be Propositions?	58-64
Four fundamental facts about judgments, which would generally be admitted	58-59
The natural interpretation of them is that every judg- ment-situation has an objective constituent, and that this is neutral, timeless, and independent of being judged	59
If the relation of being judged is dyadic, such objective constituents must be internally complex	6061
It is possible that this relation is not dyadic. Those who hold that there are propositions assume that it is dyadic	61
They also hold that truth and falsehood, in their primary sense, belong to propositions, and that they belong only in a derivative sense to judgments .	62
Propositions must be distinguished from facts because there are false beliefs and true disbeliefs	62–63

CONTENTS	xiii	
And because true belief must be distinguished from		
	page 63	
Summary. Definition of the term "Proposition".	63-64	
2. Must we assume that there are Propositions? .	64-78	
The facts described above may be expressed by saying that there are "Co-referential Sets of Judgments"	64	
2.1. Co-referential Sets of Judgments	64-66	
It is possible to define a Pickwickian sense of the word "Proposition" in terms of co-referential sets	64	
There certainly are "Propositions", in this sense, and they certainly have the properties usually assigned to them, if these be suitably re-defined	65	
2.2. The Intentionality of Judaments	66-78	
Does the fact that judgments are "intentional" imply that there are propositions in the literal sense?	66	
2.21 Correferential Sets do not require Propositions	66_68	
McTaggart accounts for co-referential sets by means	00-08	
of the Correspondence Theory of truth, without		
assuming that there are propositions	6667	
But this theory of truth is not universally accepted .	67	
And it is possible to account for the facts without it	67-68	
2.22. Does the Intentionality of Judgments require Pro- positions?	68–70	
The argument for the affirmative answer to this ques-		
tion	68-69	
It is inconclusive, for the objective constituents of judgments might not be public or neutral or time.		
	69-70	
2.221. McTaggart's attempt to dispense with Propositions	70-71	
What does McTaggart mean by saying that every belief "professes" to correspond to a certain fact?	70	
When this metaphorical expression is interpreted his argument breaks down	71	
*2.222. Independent Attempt to dispense with Propositions	71-76	
Example of a singular characterising judgment. It involves knowledge of three facts. This may be called		
its "Noetic Framework"	72	

΄.

xiv

There must also be a special relation between this knowledge and the thought of a certain one alter- native. This relation may be called "Insertion" in the case of belief, and "Extrusion" in that of dis-	
belief	page 72–73
Generalisation of the example	73-74
Analysis, on the same lines, of an existential judgment	74-75
Further generalisation; "Knowing" and "Taking for	
granted"	75–76
2.23. The Correspondence Theory	76-78
McTaggart was mistaken in thinking that supporters of the Proposition Theory regarded propositions as the objects to which true judgments correspond.	77
Criticism of McTaggart's form of the Correspondence	
Theory	77-78
Restatement of the Correspondence Theory	78

CHAPTER V

CHARACTERISTICS. (I) DIVISION INTO QUALITIES AND RELATIONS

1.	McTaggart's Classification	81-84
	The difference between Qualities and Relations can be described but not defined. Relations and Relation- ships	81
	Every relationship generates a "Relational Quality" and also another relation, according to McTaggart	82
	McTaggart seems to confuse generated relationships and generated relations	82-83
	Characteristics which are not generated are called "Original". Original qualities and the relational qualities directly generated by original relationships are called "Primary Qualities". All other qualities	
	are called "Repeating Qualities"	83

CONTENTS	xv
2. CRITICAL COMMENTS ON THE ABOVE CLASSIFICATION	page 84-98
2·1. Arguments against Relations	84-87
Leibniz's argument is circular	84
Bradley's argument depends on treating relations as if they were particulars	84-85
It also involves a failure to distinguish between what is presupposed by all relational judgments, as such, and what each relational judgment expresses	85-86
Attempt to state the real ground of Bradley's objec- tion to relations	86-87
2.2. Can Qualities be dispensed with if Relations be ac-	
cepted?	87-89
McTaggart dismisses the question without adequate	
discussion	87-88
Independent discussion of the question	88-89
2.3. Can a Term be related to itself?	90-92
McTaggart holds that it can. His examples fall into two classes	90
In the first class the alleged relation of a term to itself is symmetrical. It is doubtful whether a term can stand in such a relation to itself	9091
In the second class the alleged relation is non-sym- metrical. We must distinguish between direct and indirect relations	91
It is doubtful whether a term can stand in any direct	
relation to itself	91-92
2.4. Generated Characteristics	9298
McTaggart thinks that people have wrongly believed that relations can be reduced to qualities because	
they really do generate qualities	92-93
$2.41.$ Qualities generated by Relationships \ldots .	93-94
McTaggart is probably mistaken in holding that there are any such qualities	93-94
2.42. Relationships generated by Qualitics	9496
The distinction between the "Constituents" of a fact and their "Form of Union" in the fact	94
The fact that certain constituents are united in a cer- tain way in a certain fact is a new fact generated by	
the former	94-95

,

xvi	CONTEN	ITS		
This generated fact may slightly extended sens	y be called .	"relationa ·	l" in •	a . page 95-96
2.43. Relationships generat	ed by Relati	onships		. 96–98
An argument like the on there are such relation relationships is unenc	e just ment ships. The s ling, but i	ioned prov eries of gen t is not le	res tha nerate ogicall	ut d y
vicious	•••	• •	•	. 96-98
3. THE "NATURE" OF A T	ERM .			. 98–100
McTaggart defines this qualities	as the conj	unction of	i all i	ts . 98

positional properties de	eferred to Cl	nap. xiv, S	ection	.3 100

CHAPTER VI

CHARACTERISTICS. (II) DIVISION INTO SIMPLE, COMPOUND, AND COMPLEX

1. STATEMENT OF MCTAGGART'S THEORY	101-107
1.1. Simple, Compound, and Complex Characteristics .	101-102
Characteristics are first divided into "Simple" and "Composite", and composite characteristics are then subdivided into "Compound" and "Complex"	101
A second view of the state of t	101
An analysis may be "partial" or "total", and a total analysis may be "proximate" or "ultimate"	102
1.2. Must a Composite Characteristic have an Ultimate Analysis?	102107
McTaggart holds that it must, though the ultimate analysis may be of infinite complexity	102-103
He seems to have confused knowing a composite cha- racteristic with knowing its ultimate analysis	103-104
For, otherwise, how could he be so sure as he is that no human mind could know any characteristic which	
had an infinitely complex ultimate analysis?	104

CONTEN	\mathbf{T}	S
--------	--------------	---

Attempt to interpret and criticise McTaggart's argument. So far as it is intelligible it seems to be in-	104 105
	page 104-105
A second argument of McLaggart's .	105-106
He fails to notice that it is symbols, which are parti- culars, and not characteristics that "have meaning"	106
Though he has produced no valid argument for his contention, it may be true and even self-evident .	106-107
2. Independent Discussion of the Subject	107 - 127
2.1. Compound Characteristics	107-108
It seems very doubtful whether there are such cha- racteristics	107-108
9.9 McTaggart's tasit Assumptions	109-111
He seems to have been guided unwittingly by an analogy between composite characteristics and	100-111
figures composed of dots	108 - 109
This analogy breaks down in at least two respects $\ .$	10 9–110
McTaggart's only test for the distinction between simple and composite, compound and complex,	
characteristics seems to be linguistic usage	110111
*2.3. The Nature of Analysis	111-118
between certain particulars. Different kinds of like-	111
A likeness may be more or less "extensive" and more	
or less "intensive"	111-112
The notion of an "Aggregate Resemblance" between certain particulars. A common name may be given	
in respect of an aggregate resemblance	112-113
Analysis of a more extensive aggregate resemblance into a conjunction of several less extensive aggre-	119 114
Suggested definitions of the terms "Simple" and	115-114
"Composite", "Definable" and "Indefinable".	115-116
*2·31. Inseparable Characteristics	116-118
Inseparable characteristics are here taken to be de- terminables whose determinate values are capable of independent variation	116
Instead of talking of several inseparable characteristics	
we may talk of a single determinable with several "degrees of freedom"	117

xvii

It is possible that familiar determinables, like colour. have more degrees of freedom than we suspect . page 117-118 *2.4. The Nature of Definition 118-127 . . 118 - 119Relation of analysis to definition The formulation of a definition of a word is the sign that an aggregate resemblance has been analysed into a conjunction of less extensive resemblances . 119 The element of linguistic convention which is present 119 - 120in all definitions . *2.41. Three important Kinds of alleged Definition 120 - 127*2.411. Definitions in Arithmetic 120 - 121The nature of the Arabic notation and of the rules of Arithmetic . 120-121 . . . *2.412. Definitions in Geometry . 121 - 125There is no objective ground for singling out one of the innumerable properties of the circle as its "definition" 122 . • "Sensible Circularity" is indefinable. "Mathematical Circularity" is described in terms of sensible circularity; this is its "Primary Description" 122 - 123The ordinary "definition" of "circularity" is really an "Immediate Secondary Description" of it. Other properties of the circle are "Mediate Secondary Descriptions" 123 . . . Three comments on these distinctions 123 - 124A fourth comment. Properties which are inseparable in one system of geometry will not necessarily be so in another . . 124 - 125. *2.413. Definitions of Natural Kinds . 125 - 127They are not definitions in the strict sense. Locke's "rational parrot" settles this point 125They function as definitions only because of a contingent law of co-existence within a set of characteristics 125 - 126The various properties of a geometrical figure are mutually inferable, those of a Natural Kind are not. Two reasons why this distinction is less important than it seems at first sight 126 . . The real distinction between Natural Kinds and kinds of geometrical figure 126 - 127. . . .

CHAPTER VII

PARTICULARS. (I) THE NOTION OF SUBSTANCE

McTaggart uses two arguments to show that anything which had existence would necessarily have some other characteristic. The first is circular	page 128-129
The second tacitly assumes the empirical premise that there is at least one characteristic beside existence	129
Every existent, according to McTaggart, lacks some characteristic. Another empirical premise is tacitly assumed in his argument here	129–130
Every existent has as many qualities, positive and negative, as there are positive qualities	130131
Every existent has at least one positive quality beside existence	131
1. SUBSTANCE	131-166
1.1. McTaggart's Notion of Substance	132-141
McTaggart's definition would make facts substances, which he did not intend. Even when this is allowed for, it defines "Particulars" rather than "Sub- stances" in the usual sense	132
McTaggart's proof that there are particulars. It is conclusive	133
McTaggart's refutation of the view that a "substance" is really a complex quality. He probably misunder- stood the theory	133–134
The theory, as interpreted by him, is certainly false; but his refutation of it is invalid	134–135
McTaggart's answer to the objection that a particular would be "a something, I know not what"	135-136
McTaggart suggests three causes which have made many people doubt whether there are particulars,	100
whilst not doubting that there are characteristics.	130
Prof. Stout's question to believers in Substance	130-137
Supposes non-relational facts	137
It is not clear what Prof. Stout means by his question	137 - 138
McTaggart uses the word "substance" to cover both occurrents and continuants, and tacitly assumes that there is no fundamental distinction between	
the two	138-139

Prof. Stout regards the distinction as fundamental, and confines the name "substance" to continuants. He also holds a peculiar theory about universals.	page 139
Attempt to give a clear statement of Prof. Stout's theory	139–140
The differences between McTaggart and Prof. Stout reduce to two. Criticisms on Prof. Stout's theory.	140-141
It is possible that there is really no serious difference between McTaggart and Prof. Stout about con-	
tinuants	141
*1.2. Independent Discussion of the Notion of Substance	141-166
It is unreasonable to ignore the <i>prima facie</i> distinction between occurrents and continuants	142
*1·21. Processes and Things	142-151
Processes and Things are, <i>prima facie</i> , two different kinds of particulars	142-143
Some particulars seem to be clear instances of Pro- cesses; some to be clear instances of Things; and some to occupy an ambiguous position	143
A Process is something to which the adjectives "starting", "stopping", and "going on" can be literally annied	149-144
There is a derivative sense in which these adjectives can be applied to compound Things	145-144
Kant's objection to the Scholastic proof of the im- mortality of the soul. It is either invalid or irrele-	
vant to the Scholastics	144-145
Independent discussion of this argument	145-146
Things "persist through" periods; Processes "go on for" periods	146
Processes have temporal parts, which are successive phases; and they are qualified by adjectives like "steady" and "fluctuating"	147
Difference between "I hear the same noise again" and "I see the same chair again"	147-148
Dispositional and non-dispositional adjectives	148_140
The former can be conjoined with Thing-names, not	110-140
with Process-names	149-150
Summary of this sub-section. Philosophical relevance of grammatical distinctions	150-151

xx

CONTENTS	xxi
*1.22. Can either Things or Processes be dispensed with? page	151-166
Meaning of the question	151
Some would hold that every Process must be a state of, or a process in, or a set of facts about, a Thing	151-152
If a buzzing noise is going on, what Thing is the sub- ject of this Process?	152-153
It is difficult to conceive of any kind of answer to such a question when it is rightly understood	153
Those who hold that noises are mental would not be prepared to say that some mind is buzzing whenever a buzzing noise is going on	153-154
Perhaps they would say that some part of some mind	154
Analogies and differences between a noise and a move- ment. There is no analogy in the case of sound to	101
seeing an object resting This increases the difficulty of regarding a process of	154-155
sound as the changing of some Thing in respect of some quality	155
The upshot of the discussion is that we may have to admit the possibility of "Absolute Processes" .	155156
It seems impossible to regard a Process as a set of facts about a particular, a series of determinate cha- racteristics, and a series of moments	156
Can Things be dispensed with in favour of Processes? The case of physical movements	156-157
We talk of waves and shadows as "moving". Distinc- tion between "Transmission of State" and "Trans- lation of Stuff"	157
It might be alleged that transmission of state involves periodic translation of stuff	157–158
But this view need not be accepted by those who accept substantival Absolute Space	158
We talk of a Process "continuing" and yet "changing in certain respects". Analysis of such statements	159
To state the analysis accurately we need to introduce the notion of "Quality-Ranges"	160
Enumeration of certain properties of quality-ranges	160-162
Summary of the argument about Absolute Processes	162–163
What is the nature of visual sensibilia and images? They seem more like Things than like Processes	163

Can one literally "hear" a sound moving or resting? page	163164
If so, we can give an analysis of "the motion of a sound" in terms of "Place-Ranges"	164
It seems antecedently likely that visual sensibilia and images are of the same nature as auditory ones, and that therefore they are Processes	164-165
If they are Processes, their "motion" can be analysed as we analysed the "motion" of a sound	.165
Enumeration of certain causes which make us think that visual sensibilia are Things and not Processes. These causes are not valid reasons	165-166
Summary. It seems not unlikely that Things can be dispensed with in favour of Processes; but certain questions remain, which are deferred to a later	•
chapter	166

CHAPTER VIII

PARTICULARS. (II) THE PLURALITY OF PARTICULARS

We know empirically that there is more than one	
particular	167
The occurrence of any sensation or introspection en- tails this, according to McTaggart	167-168
This seems to be true on any possible analysis of sensation	168
The mere occurrence of a judgment would not prove that there is more than one particular except on certain views of the nature of judgment which would not be universally accepted	168169
McTaggart thinks that, on any view of the nature of judgment, the knowledge that a judgment had occurred would entail that there are at least two particulars. This seems doubtful	169
Other empirical evidence for there being several particulars	169-170
The fact that there are many particulars is com- patible with their together constituting one com-	
pound particular	170

CHAPTER IX

THE DISSIMILARITY OF THE DIVERSE

McTaggart holds that no two particulars can be	
exactly alike	page 171
Difficulties in McTaggart's account of "exact likeness"	171 - 172
Suggested modification of his definition	172
McTaggart restricts himself to dissimilarities which are not analytical consequences of diversity	172-173
The question of possible exceptions must be discussed separately for occurrents and for continuants .	173
Hypothetical case of two sensibilia	173 - 174
It seems logically possible that they might be exactly alike in all the characteristics which McTaggart is	
considering	174 - 175
An objection raised and answered	175
Hypothetical case of two minds	175176
It seems logically possible that they might be exactly alike in all the characteristics which McTaggart is	
considering	176
Causes which may have tended to make the Dis- similarity of the Diverse seem plausible even if it be	
false	176-177
McTaggart thinks that the principle has been doubted because of an invalid distinction between the "nature" and the "individuality" of a particular.	
Reasons for questioning this	177

CHAPTER X

THE PRINCIPLE OF SUFFICIENT DESCRIPTIONS

"Exclusive", "Complete", and "Sufficient Descrip- tions" defined	178
The Dissimilarity of the Diverse entails that every particular has an exclusive description	178-179
Sufficient descriptions of various "orders" explained and illustrated	179
McTaggart professes to prove that, if every particular has an exclusive description, then every particular must have a sufficient description. A hypothetical	
contrary instance suggested	181-182

BOOK III

DETERMINATION

Argument of Book III	187
CHAPTER XI	
INTRINSIC DETERMINATION	
The two kinds of "Determination", and the notions connected with them	189
l. Implication	189–195
McTaggart defines "Implication" in terms of pro- positions, though he has rejected them. And his statements are obscure and confused	189–190
False conjunctive propositions, and "Inconsistencies"	190
Valid inference is possible only because there are in- consistencies which we can recognise without need- ing to know the truth or falsity of their constituent propositions	190–191
"Logical" and "Ontological" Inconsistencies distin- guished	191-192
Restatement of the doctrine in terms of facts and judgments	192
Definition of "Implication", as used at Cambridge .	192-193
Definition of "Entailment", as used at Cambridge. McTaggart meant the latter by "implication"	193–194
Relation of entailment to implication	194
"Formal Implication" and "Formal Entailment" .	194 - 195
"Logical" and "Ontological" Entailment distin- guished	195
2. INTRINSIC DETERMINATION	195-200
McTaggart's statements on this subject	195-196
Obscurities and verbal confusions in them	196-197

McTaggart confused intrinsic determination with	
another relation which he did not name or explicitly	
recognise. We will call it "Conveyance" pag	je 197–198
Definition of "Conveyance". If ϕ conveys ψ , it also	
intrinsically determines ψ	198
Discussion of McTaggart's examples in the light of	
this distinction	198-199
Intrinsic determination and conveyance of relational	
properties	199-200

CHAPTER XIII

.

CAUSATION

1. McTaggart's View of Causation	212-221
It consists of a part which McTaggart regards as non- controversial and a part which he regards as contro-	
versial	212
1.1. The "non-controversial" Part	212-218
Accurate formulation of this, with examples	213 - 214
Summary of the above	214
A causal law is, on this theory, an instance of onto-	
logical formal entailment	214 - 215
It would not be universally admitted that causes and	
effects are facts	215
Nor that causal connexion is a species of conveyance	215 - 216
McTaggart gives no satisfactory reason for holding that causal connexion is a species of conveyance .	216
Many philosophers, e.g., Hume, would unhesitatingly	
reject this doctrine	217
If McTaggart be right, causal laws will differ only	
epistemologically from a priori propositions	217 - 218
1.2. The "controversial" Part	218-221
On McTaggart's view, if two facts are causally con- nected and the date in one is earlier than that in the other, the fact with the earlier date is called the "cause" and the fact with the later date is called	
the "effect"	218

CONTENTS	xxvii	
The relation of conveyance will not itself mark out one fact as cause and the other as effect	page 218–219	
For, in some cases, it relates two facts reciprocally. And, in other cases, the date in the conveying fact is later than the date in the conveyed fact	219	
Nor can one fact be marked out as cause by being active with respect to the other or by explaining the other	219-220	
McTaggart seems to confuse activity with awareness of activity	220-221	
2. McTaggart on the Uniformity of Nature	221-223	
Statement of the Principle. It is not self-evident, and there is no known proof of it	221-222	
2.1 Reciprocal Determination	222-223	
It is quite certain that causal determination is not in		
all cases reciprocal	222	
Probably those philosophers who asserted that it is meant something less sweeping than McTaggart supposed. But there is no reason to believe that		
what they meant is true	222-223	
3. McTaggart on Induction	223-228	
Observed regularity is no ground for believing in a corresponding uniformity unless it be a ground for	009	
Suspecting the presence of a relation of conveyance	223	
ing the presence of a relation of conveyance .	223-224	
McTaggart's argument to prove this	224	
It contains a fallacy	224 - 225	
But he himself supplies the correct argument, viz., that we should need to know, independently of the observed data, that there is a finite antecedent probability of conveyance in the case under discus-		
sion	225	
The fact there there are laws of conveyance which can be known <i>a priori</i> is irrelevant for the present	00× 000	
Purpose	220-226	
there must be laws of conveyance which cannot be known <i>a priori</i> . But even this will not help Induc-		
tion, and it is difficult to see how philosophy could		
do more for Induction than this	226	
	C-2	
•		

Our beliefs in the results of induction may have some rational basis; but none has been discovered .page 226-22 .page 226-22 If causal laws be necessary facts, why can we never intuit or demonstrate the necessity of any causal law?	xxviii	CONT	ENTS

CONTENTS	xxix	
Is Indeterminism compatible with the Principle that every change which issues from a moment must be caused by changes which enter into that moment?	page 238	
It might be that each different alternative choice has a different necessary condition, whilst none has a sufficient condition	238-239	
If the various necessary conditions exclude each other, no alternative could have been chosen except the one which actually was chosen	239-240	
If, however, the various necessary conditions do not exclude each other, any alternative could have been chosen instead of the one which actually was chosen	240	
*4.3. Analysis of Causal Statements	241-245	
The generally accepted analysis defines singular causal statements in terms of causal laws	241	
If it be accepted, the question is pushed back to the analysis of causal laws and the grounds for believing		
such laws Causal laws seem to be necessary facts whose necessity is contingent. But this looks very much like non-	242	
sense	242-243	
Is the generally accepted analysis of singular causal	0.40	
statements correct?	243	
Whether the willed movement issues or not, I know with regard to <i>some</i> change which issues that it would not have done so unless the volition had	240-244	
entered	244	
Such knowledge may not arise without some previous experience of parallel cases, but it is not based on a knowledge of general laws	244-245	
Knowledge of <i>some</i> singular causal propositions would seem to precede knowledge of <i>any</i> causal laws. The latter in turn becomes the ground for believing other		
singular causal propositions	245	
CHAPTER XIV		
EXTRINSIC DETERMINATION		

	EXTRINSIC DETERMINATION		
1.	STATEMENT OF MCTAGGART'S DOCTRINE	246-249	
	The supposition that any particular was in any respect other than it in fact was at a given moment is, if		
	taken literally, internally inconsistent	246	

CONTENTS xxx Hence it is inconsistent to combine the supposition that any fact about A is not with the supposition that any fact about A is page 247 Extrinsic Determination is really a relation between facts, and not, as McTaggart asserts, between qualities 247 - 248Extension of the doctrine. It is inconsistent to combine the supposition that any fact about A is not with the supposition that any fact about B is 2482. CRITICISM OF MCTAGGART'S DOCTRINE 249 - 264McTaggart seems to have confused two different, but verbally similar, propositions 249 One is obviously true, but is not what he needs; the other is what he needs, but is not obviously true . 250The Principle tends to be accepted because of a confusion between a wider and a narrower sense of the phrase "the nature of a term" 250 - 251. Could the nature of A have been poorer than it in fact is, through the non-existence of B to which A in fact stands in the relation R? 251 - 252This depends on whether it is consistent to suppose that B might not have existed. And this depends on whether B is known by acquaintance or only by description . 252. • . Illustrations of the above contention 252 - 254Further discussion and illustrations 254 - 255Summary and conclusions 255 - 256. . Application to the argument by which the Principle of Universal Extrinsic Determination was supposed to be proved 256. . . It breaks down at the second step unless A be supposed to be known only by description 256 - 257The nature of a particular might have been richer than it in fact was, if certain other particulars had existed which in fact did not exist 257 - 258. Could two particulars, which in fact stood in a certain relation to each other at a certain moment, have stood in a different relation to each other at that moment? . . 258The supposition has a meaning if both particulars are known only by description, and if the descriptions do not entail that their instances must stand in the relation in question 258 - 259

CONTENTS	XXXI
The supposition is meaningless if both particulars are known by acquaintance to the supposer	page 259–260
Summary. Neither necessity nor contingency applies to singular facts about particulars which are known by acquaintance	260-261
Fallacies arise through the ambiguity of the phrase:	961
Restatement of our conclusions	261_262
It is possible that this is what McTaggart had in mind when he formulated the Principle of Extrinsic Determination	262-263
On both views there is lack of contingency where most people think that there is contingency. But, on our view, there is also lack of necessity, because modality	069
Application of our conclusions to the case of human	203
voluntary decisions	263-264
*3. THE "NATURE" OF A CONTINUANT	264-278
This seems to be the place to discuss the distinction between what a thing actually did and what it	
would have done if it had been differently situated	264
*3.1. The Popular-Scientific View	265 - 273
Distinction between the nature and the circumstances of a thing, and between its actual and its possible	96 r

COMPOUND PARTICULARS. THE UNIVERSE

301	Every group is a compound particular, and every compound particular is a group
301-307	. McTaggart's Doctrine of Compound Particulars
	McTaggart holds that different groups can be the same
301-302	particular
302	This doctrine is false, and his defence of it is unsound
303	The truth is that the same particular may be ade- quately divisible into several different groups. Re- statement of the doctrine
304-305	•1. Criticisms
304	When McTaggart's doctrine is so stated as not to be nonsensical it ceases to be plausible
	Probable origin of McTaggart's doctrine. It is plausible only when there happens to be one outstanding group in a set of groups which have the same con-
304-305	tent

CONTENTS	xxxv
1.11. Suggested Modification of McTaggart's Doctrine . page	e 305307
Restatement of McTaggart's doctrine	305-306
Reasons why it needs modification	306
Every non-repeating group may be called a "Com- positum"; and, if two composita have the same content, each can be called a "set of parts" of the	
other	306-307
2. The Universe	307-309
McTaggart defines "being a universe" as being a particular of which all other particulars are parts. He professes to prove that this characteristic has one and only one instance	307
In view of our previous criticisms, we cannot admit that this characteristic would be unique in its	
application If a "universe" be defined as a group whose members are all non-repeating groups which have "maximum content", the condition of uniqueness will be ful-	308
filled	309

CHAPTER XVII

MANIFESTATION AND ORGANIC UNITY

- -

I. MANIFESTATION	310 - 311
In virtue of the Principles of Exclusive Descriptions and of Extrinsic Determination the parts of the nature of a thing can be called "Manifestations" of	
its nature	310-311
2. Organic Unity	311-320
2-1. McTaggart's Account of Organic Unity	311-318
Organic unity is closely connected with manifestation It consists in the fact that, if any particular which is part of a whole had not been a part of it, then no particular which is part of that whole would have	311312
been a part of it	312
they had been parts of that whole Every whole whatever is an organic unity, in the sense defined; but the fact is most noticeable in the case of those wholes which are living organisms or	312–313
beautiful objects	313

This has led to certain mistakes about organisms, and to certain other mistakes about wholes which are	
not organisms	page 313-314
The property of being an organism is a very transitory possession of those groups which ever possess it .	314-315
There is no real connexion between "organic unity", in McTaggart's sense, and the characteristic in virtue of which living organisms and beautiful ob- jects have been called "organic unities"	315-316
It seems certain that what McTaggart calls "organic unity" is not what other philosophers have meant	
by it	316
It seems likely that McTaggart himself failed to see that the fact that all wholes are organic unities, in	
his sense, is quite trivial	316-317
"The whole is in every part." "The nature of the whole is expressed in every part." These statements are false, when taken literally, and misleading when	
taken figuratively	317-318
2.2. Organic Unity and Teleology	318-320
There is no special connexion between organic unity and high positive value. But, in McTaggart's opinion, the use of the name "teleological system", and confusions between extrinsic and intrinsic teleology, have led to the mistaken belief that there	
is	318-319
It may be doubted whether McTaggart is not cari-	
caturing the philosophers whom he is here criticising	319-320

CHAPTER XVIII

THE SUBDIVISION OF THE UNIVERSE

. Exclusive Common Qualities in Groups	1
Characteristics may be divided into those which qualify nothing, those which qualify everything, those which qualify one and only one thing, and those which qualify more than one and less than all	
things	
The last of these are called "Exclusive Common Qualities"	
Distinction between trivial and non-trivial exclusive common qualities .	
	. EXCLUSIVE COMMON QUALITIES IN GROUPS Characteristics may be divided into those which qualify nothing, those which qualify everything, those which qualify one and only one thing, and those which qualify more than one and less than all things

xxxvi

CO	N	\mathbf{T}	\mathbf{E}	N	т	S
----	---	--------------	--------------	---	---	---

xxxvii

In every group there are two trivial exclusive common qualities. But we have so far found no evidence that there must be a non-trivial exclusive common	
quality in every group page	322-323
2. Are there Natural Subdivisions in the Universe?	323–325
A whole may be ordered by causal, by serial, or by classificatory relations. We have no evidence, so far, that the universe is an ordered system in any of these	
respects	323-324
Some groups seem to be more important and more	
highly unified than others	324-325
But this might be a mistake due to ignorance; and we have no evidence, so far, that any group is ob- jectively more important or more highly unified	
than any other	325

CHAPTER XIX

THE ENDLESS DIVISIBILITY OF PARTICULARS

We have failed, so far, to show that there is any natural intrinsic "grain" in the universe	326
The doctrine that there are no particulars which are not themselves groups seems, at first sight, to make the search for a natural "grain" even more hopeless than before	326-327
But, in order to avoid a contradiction which, it is alleged, would otherwise be involved in endless divisibility, McTaggart introduces the Principle of Determining Correspondence. And this principle	
entails that the universe has a natural "grain".	327
1. McTaggart's Doctrine	327-343
McTaggart finds it self-evident that every particular is	397
Explanation of this doctrine and its immediate conse-	021
quences	328
1.1. Relation of McTaggart's Doctrine to other Theories.	328341
McTaggart's objection to the orthodox mathematical theory is, not that it involves an <i>infinite number</i> of	
particulars, but that it involves simple particulars	329

xxxviii

Both McTaggart and the orthodox mathematicians felt a difficulty in accepting endless divisibility as an ultimate fact. The latter claimed to avoid the difficulty by postulating an infinite number of simple particulars; but this expedient was not open	
to McTaggart	page 329-330
1.11. The Orthodox Mathematical Theory	330332
McTaggart regards the propositions that a particular has no simple parts and that it has an <i>infinite num-</i> ber of simple parts as mutually exclusive	330
But we must distinguish two senses of "having parts", viz., "containing as parts" and "comprising as members"	331
The mathematical theory is that a line comprises an infinite number of simple <i>members</i> (points), but contains no simple <i>parts</i> (indivisible lines); and that these two propositions entail each other .	331-332
The mathematical theory is internally consistent; but McTaggart could not have accepted it, even if he had understood it, since it involves simple parti- culars	332
1.12. Whitehead's Theory	333-336
Whitehead defines "points" in such a way that they will do the work required of them in geometry, without assuming that there are simple particulars	333
But he leaves untouched the alleged difficulties in accepting the endless divisibility of particulars as an ultimate fact	333-334
In geometry we start with volumes and their per- ceptible relations, and we reach the notion of points only at the end of an elaborate intellectual process	334-335
In arithmetic we start with the notion of integers, then pass to that of a compact series of rationals arranged in order of magnitude, and finally reach	
the notion of segments and their adjunction .	335-336
*1.13. Prof. Strong's Theory	336341
Objections to the orthodox theory as an account of the physical continuum	336-337
Statement of Prof. Strong's theory. Two unextended points which stand in the relation of "junction"	
form a minimal straight line	337–338

CONTENTS	xxxix
General criticisms of the theory. Can there be mini- mal lengths? And could an infinite number of them form a finite line by adjunction with each other? . Special difficulties in the case of space. There could be only three co-planar straight lines through any point	page 338–339 339–340
And many pairs of points would not be collinear .	340-341
1.2. McTaggart's Theory of Dimensions	341–343
Mclaggart's doctrine is that every particular must be divisible in at least one dimension, but need not be divisible in more than one dimension	341
Explanation of divisibility and indivisibility in a dimension	341-342
Even if geometry requires points which are spatially	
indivisible, they may be divisible in some other dimension	342343
2. Is McTaggart's Principle self-evident?	343-351
We do not perceive any particular as simple	343
The fact that there must be simple characteristics casts no doubt on the principle that there can be no simple particulars	344
Many philosophers who are supposed to hold that there are simple particulars really hold only that there are continuants which are not composed of other continuants .	344-345
Three reasons why we should be cautious, in McTag- gart's opinion, in accepting his Principle	345
Alternative ways of stating the Principle. A simple particular would have no "filling", no internal structure, no duration, and no history	345-346
But is it obvious that an occurrent must have an internal structure, or duration, or a history?	346-347
McTaggart always identifies a continuant with that set of events which is its history. And he appeals to considerations about duration and history, though he rejects both time and change	347
Those who admit the reality of time might admit that every continuant has a history which is endlessly divisible into shorter and shorter successive phases	347348
Unless a continuant be identified with its history, this would be compatible with the existence of simple	

continuants. And, in any case, it would be com- patible with the existence of instantaneous occur- rents	page 348
If instantaneous particulars be rejected, it must be on the ground of their indivisibility in the <i>temporal</i> dimension. The question whether they are or are not divisible in some <i>other</i> dimension is irrelevant.	348-349
There seems no conclusive objection to the possibility of instantaneous occurrents	349
It is certain that a continuant cannot be identified with its own history	349-350
It might be that continuants are neither instantaneous nor temporally extended; these alternatives may apply only to events or processes	350
McTaggart holds that nothing is really temporal, and that particulars are <i>not</i> endlessly divisible in that dimension which is misperceived as duration. So his appeal to temporal considerations in support of the Principle of Endless Divisibility seems hardly consistent	950 951
	00-001
*3. SOME FURTHER REMARKS ON DIVISIBILITY	351-356
The notion of a compound particular and its history	351 - 352
If each part could have existed in the absence of the rest, and if the parts could have been differently interrelated, the whole is called an "Extrinsic Unity"	352
Even when this is logically possible it may be causally impossible. The whole may then be called an	001
"Organic Compound"	352-353
If no part of a whole could have existed without the rest, and if the parts could not have been differently interrelated, the whole is called an "Intrinsic Uniter"	959
A region of Newtonian Absolute Space would be an	202
intrinsic unity	353-354
Endless divisibility would be harmless in the case of an intrinsic unity	354
The atoms of old-fashioned physics were organic	954 955
compounds, not intrinsic unities	304-305 955 950
Sketch of an alternative theory of extended atoms .	300-300

xl

CHAPTER XX

THE IMPLICATIONS OF ENDLESS DIVISIBILITY

page 357	The question is whether the endless divisibility of particulars is compatible with the Principle that every particular has a sufficient description .
357-360	. PRELIMINARY EXPLANATIONS AND DEFINITIONS
358	Definition and illustration of the notion of a series of sets of parts of a particular
358-359	From sufficient descriptions of the members of any set we can derive sufficient descriptions of all mem- bers of all earlier sets in the series
359	Some particulars might be sufficiently describable only in this way
359–360	Sometimes we can derive from a sufficient description of a particular sufficient descriptions of all the members of one or more sets of parts of it. Such a particular is "descriptively fertile"
360	If a particular had a sufficient description from which we could derive sufficient descriptions of all the members of all the terms in an unending series of sets of parts of it, it would be a "Descriptive Ancestor"
360-369	2. McTaggart's Arguments
360-361	McTaggart claims to prove (i) that every series of sets of parts must contain a descriptive ancestor, and (ii) that the entailment of the other descriptions by that of the ancestral term must be synthetic
961 964	Durant of Durancestican (i)
301-304 261	The argument divides into three starses (a) (b) and (c)
301	Stage (a) . The conclusion is stronger than the premises
361-362	warrant
362	Stage (b)
	Stage (c). The supposition that there is no descriptive ancestor entails a proposition which McTaggart holds to be inconsistent with the conclusion of
362-363	stage (a)
0.40	Really there is no inconsistency. McTaggart has been misled by the ambiguity of the sentence: " S must be
303	Thustration of this ambiguity
эвэ-эв4 d	B MCT

Proposition (i) is an invalid inference from uncertain	
premises	page 364
2.2. Proof of Proposition (ii)	364-367
A particular could be sufficiently described by con- joining sufficient descriptions of all its parts in any series of sets of parts of it. Such a description would <i>analytically</i> entail sufficient descriptions of	
all these parts	364-365
But any such description, if adequate, would be more	
than adequate for the purpose	365
According to McTaggart, any description which is adequate for a given purpose must be, or must contain, a description which is <i>only just</i> adequate	
for that purpose	366
So a description of a whole which conveys sufficient descriptions of all its parts <i>only</i> by analytically con- taining the latter will not do	366
McTaggart would have done better to deny that such	
a sufficient description as this is possible	366-367
2·3. McTaggart's Supplementary Argument	367-369
This is supposed to render both Propositions (i) and	
(ii) highly probable	367
It assumes the conclusion of stage (a) of the proof of	967 960
McTaggart holds that, unless Propositions (i) and (ii) were true, it is infinitely unlikely that the proposi- tion proved in stage (a) would be true. Therefore (i)	307-308
and (ii) are almost certainly true	368
Four reasons for hesitating to accept this argument.	368-369

BOOK V

DETERMINING CORRESPONDENCE

Argument of Book V

371

CHAPTER XXI

THE PRINCIPLE OF DETERMINING CORRESPONDENCE

McTaggart thinks that the conditions, which must be fulfilled if a contradiction over endless divisibility is to be avoided, can be fulfilled in only one way.

373-374

CONTENTS	xliii
1. GENERAL TREATMENT OF THE PROBLEM	page 374378
The original condition can be split up into a conjunc- tion of two conditions. (i) There must be a "Funda- mental Hierarchy"; and (ii) Any particular which does not itself fall into a fundamental hierarchy must have a set of parts each of which does so	374–375
1.1. Geometrical example of a fundamental hihrarchy .	375-377
Fulfilment of the second condition in the geometrical example	377
The possibility of this geometrical example suffices to refute several of McTaggart's fundamental doctrines	377-378
2. DETERMINING CORRESPONDENCE	378-400
McTaggart's statements are obscure and his notation is unsatisfactory, but his meaning can be gathered from his examples	378-379
2.1. McTaggart's Example	379-385
Four suppositions are made about the nature and range of perception	379
Here they are taken merely as hypotheses. McTaggart defends their truth in Vol. II	379-380
The example is a "Mutual Admiration Society", composed of two minds subject to certain rules .	380
Statement of the thirteen rules of this society .	381-383
Such a society would fulfil the required conditions, and its parts would form a Determining Correspond- ence Hierarchy	383-385
2.2. Generalisation of the Example	385388
We remove the restriction to <i>two</i> primary parts, and we state in general terms the formal characteristics which we ascribed to the relation "being a percep-	206
tion of " in the example	386
"Determining Correspondence Hierarchy"	385-387
2.21. Illustration of the above Conditions by McTaggart's Example	387-388
2.3. Proof that the Conditions suffice	388-390
2.4. Symbolic Statement of the Conditions	390
2.5. Relaxation of the Conditions	390-392
-	<i>d</i> -2

It might be that, whilst every primary part is con- tained in the differentiating group of <i>some</i> primary part, none is contained in the differentiating group of <i>every</i> primary part	page 390–391
It might be that some primary parts are not contained in the differentiating group of any primary part .	391
There might be some primary parts whose differen- tiating groups do not contain any primary parts .	392
2.6. Final Account of Determining Correspondence .	392-398
McTaggart's account of how the descriptions of the secondary parts are derived from those of the primary parts in a determining correspondence hierarchy is extremely obscure	392–393
Explanation, by means of an example, of a rule of derivation	393-394
General account of such a rule. In our method it in- volves a rule for deriving the symbol of any secondary part, and a rule for translating that symbol into a sufficient description	394 –395
2.61. Definitions of some Technical Terms	395-396
"Primary Parts", "Primary Wholes", "Super- primary Wholes", "Secondary Parts" (of various grades), and "Determinants" (direct or final), defined	395–396
2.62. Some further General Remarks	396-398
McTaggart holds that there must be a stage in any hierarchy after which none of the parts have any characteristics which are not entailed by their positions in the hierarchy. His argument depends on the notion of antecedent improbability, and	
seems very weak	396
There might be several primary wholes, each ordered by a different relation of determining correspond- ence; or a single primary whole with two different sets of primary parts and a different relation of determining correspondence for each set	396–397
Even with a single primary whole and a single set of primary parts there might be two relations of determining correspondence if certain conditions	
were fulfilled. Illustration	397-398

xliv

CONTENTS	xlv
3. SUMMARY OF THE POSITION	. page 398–400
Summary of McTaggart's argument to prove that the universe must be a determining correspondence system .)) . 398–399
Our geometrical example shows that the conditions which he thinks necessary could be fulfilled without determining correspondence	. 399
McTaggart's only ground for Mentalism is that he can think of no relation but "being a perception of" which would fulfil the conditions of a determining correspondence relation	; ; . 399–400
It seems likely that non-mental examples of a deter- mining correspondence relation could be imagined especially if one were allowed to play such tricks with the apparent properties of space and matter as McTaggart has had to play with the apparent properties of mind and percention	400

CHAPTER XXII

DETERMINING CORRESPONDENCE AND UNITIES WITHIN THE UNIVERSE

401-408	I. DETERMINING CORRESPONDENCE AND CAUSAL LAWS
401	McTaggart says that determining correspondence is a causal relation
401402	The Principle of Determining Correspondence does entail that some existent characteristics intrinsic- ally determine others
402	Exclusive laws within the universe are the only laws that are of any practical interest to science .
402-403	Example of such a law being entailed by the Principle of Determining Correspondence
404	A law may be <i>a priori</i> in three different senses which McTaggart does not clearly distinguish
405	Science requires laws which are about characteristics whose concepts are empirical; which cannot be seen by human beings to be necessary; and which apply to several, but not to all, particulars
	The Principle of Determining Correspondence does entail that there are exclusive laws about cha-
405-406	racteristics whose concepts are empirical

	But it does not entail that there are laws which no human being can see to be necessary	page 406–407
	If the Principle guaranteed that there are such laws, it would seem to guarantee the minimum condition without which induction is indefensible	407
	But this is not so; for the laws which it would guaran- tee are not about the characteristics concerning which science makes inductions	407-408
2.	DETERMINING CORRESPONDENCE AND EXCLUSIVE COMMON QUALITIES	408-416
	Every determining correspondence hierarchy leads to a "Fundamental System of Classification", with a non-trivial exclusive common quality in each of its	
	classes	408-409
	fundamental	409
	Other systems are more or less fundamental in pro- portion as they approximate more or less to a fundamental system	410
	Four ways in which the contents of a fundamental	410
	there is a non-trivial exclusive common quality .	410413
2	1. External and Internal Particulars	413416
	Every "External Particular" has a set of parts each member of which is an "Internal Particular" .	413
	An external particular can be classified by the grade of its highest-grade internal part .	413-414
	The Principle of Determining Correspondence entails that every particular, whether external or internal,	
	exclusive common quality	414-415
	The argument applies to relational properties, not to original qualities	415
	Nevertheless, the result, if true, would be of consider- able philosophic interest	415-416
3.	UNITIES OF COMPOSITION AND UNITIES OF MANI-	
	FESTATION	416-420
	Frimary and secondary parts are more appropriately described as "differentiated into" than as "built	
	spondence hierarchy	416-417
	The opposite of this is true of primary and super- primary wholes	417-418

PARTS	THE DISCRIMINATION OF PRIMARY				
491	Some, but not all, primary parts might be distin- guished only by the fact that their differentiating				
491 499	All the primary parts might be distinguished by their relations to other particulars which had independent				
421-422	Some or all of the primary parts might be distin- guished by original qualities, or by the peculiar relation in which each stands to itself or to at least one other particular or to a certain class of particu-				
422	lars				
422-423	It is not certain that every primary part is a member of some group in which there is a non-trivial exclu- sive common quality				
	CHAPTER XXIV				
ID THE	DETERMINING CORRESPONDENCE AN STRUCTURE OF THE UNIVERSE				

The Principle of Determining Correspondence is compatible with at least six alternative suppositions	
about the structure of the universe	424
1. The First Supposition	424-429
Statement of five assumptions, of which the fourth is a more determinate form of the third and the third	
is a more determinate form of the second	424-425
The first Supposition is that assumptions (i), (iv), and (v) are fulfilled	425

xlviii	CONTE	NTS					
Three consequences abo verse follow	out the str	ucture	of the	uni-	page 425-427		
On this Supposition the greatest possible unity determining correspon	e universe y which it ndence. It	would could would	l have derive be a ''	from Self-			
reflecting Unity"				•	427		
1.1. Self-reflecting Unities	• •	•			427-429		
Comparison between the Self-reflecting Unity	notions of (Organi	c Unity	y and	427-428		
Even if the universe we would still be true tha more correct theory of yal Monism	ere a self-r it Substant its structu	eflectir ival Pl re than	ng unit uralisn NSubst	ty, it n is a anti-	428-429		
9 THE SECOND SUPPOSITU	••••	•	•••	•	490-431		
We now drop assumption	n (v) and s	1100096	• • that	there	423-431		
is more than one of relation	determinin	g corr	espond	lence	429		
The first two consequen	ces are the	same	as on	Sup-	429-430		
But the third consequen	ce fails. Th	e univ	erse wi	ill no	430		
3 THE THIRD SUPPOSITION	N N	•	•••	•	431_432		
Assumption (iv) is repla	ced by the	· less d on (v) i	leterm is resu	inate med	431		
There is a loss of unity, compared with Support	simplicity,	and sy	mmet	ry as	431-432		
4. THE FOURTH SUPPOSITION	ON .	a oup			432-433		
Assumption (iii) is repla assumption (ii). There	ced by the is now less	· less d unity	.etermi amon	inate g the	102 100		
primary parts			• •	•	432-433		
5. THE FIFTH SUPPOSITION	r . .	•	• •	•	433		
Assumption (ii) is now o loss of unity	lropped. T	here is	no fu 	rther	433		
6. THE SIXTH SUPPOSITION	v			•	434		
Assumption (i) is now dropped. The universe is now a super-primary whole, consisting of several primary wholes, and therefore does not form a single de-							
termining corresponde	nce hierarc	hy	•	•	434
