PREFACE	xi
FROM THE PREFACE TO THE ORIGINAL EDITION	xvii

FIRST PART

ELEMENTS OF LOGIC. DEDUCTIVE METHOD

I. ON THE USE OF VARIABLES

1. Constants and variables	3
2. Expressions containing variables—sentential and designatory functions	4
3. Formation of sentences by means of variables—universal and existential sentences	7
4. Universal and existential quantifiers; free and bound variables	9
5. The importance of variables in mathematics	13
Exercises	14

II. ON THE SENTENTIAL CALCULUS

6. Logical constants; the old logic and the new logic	18
7. Sentential calculus; negation of a sentence, conjunction and disjunction of sentences	19
8. Implication or conditional sentence; implication in material meaning	23
9. The use of implication in mathematics	28
10. Equivalence of sentences	32
11. The formulation of definitions and its rules	33
12. Laws of sentential calculus	36
13. Symbolism of sentential calculus; truth functions and truth tables	38
14. Application of laws of sentential calculus in inference	44
15. Rules of inference, complete proofs	47
Exercises	49

III. ON THE THEORY OF IDENTITY

16. Logical concepts outside sentential calculus; concept of identity	54
17. Fundamental laws of the theory of identity	55
18. Identity of things and identity of their designations; use of quotation marks	58
19. Equality in arithmetic and geometry, and its relation to logical identity	61
20. Numerical quantifiers	63
Exercises	64

IV. ON THE THEORY OF CLASSES

21. Classes and their elements	68
22. Classes and sentential functions with one free variable	69
23. Universal class and null class	72
24. Fundamental relations among classes	74
25. Operations on classes	77
26. Equinumerous classes, cardinal number of a class, finite and infinite classes; arithmetic as a part of logic	79
Exercises	82

V. ON THE THEORY OF RELATIONS

27. Relations, their domains and counter-domains; relations and sentential functions with two free variables	87
28. Calculus of relations	90
29. Some properties of relations	93
30. Relations which are reflexive, symmetrical and transitive	94
31. Ordering relations; examples of other relations	96
32. One-many relations or functions	98
33. One-one relations or biunique functions, and one-to-one corre- spondences	103
34. Many-termed relations; functions of several variables and operations	105
35. The importance of logic for other sciences	108
Exercises	109

VI. ON THE DEDUCTIVE METHOD

36. Fundamental constituents of a deductive theory—primitive and defined terms, axioms and theorems	117
37. Model and interpretation of a deductive theory	120
38. Law of deduction; formal character of deductive sciences	125
39. Selection of axioms and primitive terms; their independence	130
40. Formalization of definitions and proofs, formalized deductive theories	132
41. Consistency and completeness of a deductive theory; decision problem	134
42. The widened conception of the methodology of deductive sciences	138
Exercises	140

SECOND PART

APPLICATIONS OF LOGIC AND METHODOLOGY
IN CONSTRUCTING MATHEMATICAL THEORIESVII. CONSTRUCTION OF A MATHEMATICAL THEORY:
LAWS OF ORDER FOR NUMBERS

43. Primitive terms of the theory under construction; axioms concerning fundamental relations among numbers	155
--	-----

TABLE OF CONTENTS

ix

44. Laws of irreflexivity for the fundamental relations; indirect proofs	157
45. Further theorems on the fundamental relations	159
46. Other relations among numbers	162
Exercises	165

VIII. CONSTRUCTION OF A MATHEMATICAL THEORY: LAWS OF ADDITION AND SUBTRACTION

47. Axioms concerning addition; general properties of operations, concepts of a group and of an Abelian group	168
48. Commutative and associative laws for a larger number of summands	170
49. Laws of monotony for addition and their converses	171
50. Closed systems of sentences	176
51. Consequences of the laws of monotony	177
52. Definition of subtraction; inverse operations	180
53. Definitions whose definiendum contains the identity sign	181
54. Theorems on subtraction	184
Exercises	185

IX. METHODOLOGICAL CONSIDERATIONS ON THE CONSTRUCTED THEORY

55. Elimination of superfluous axioms in the original axiom system	191
56. Independence of the axioms of the simplified system	194
57. Elimination of superfluous primitive terms and subsequent simplification of the axiom system; concept of an ordered Abelian group	196
58. Further simplification of the axiom system; possible transformations of the system of primitive terms	199
59. Problem of the consistency of the constructed theory	204
60. Problem of the completeness of the constructed theory	205
Exercises	207

X. EXTENSION OF THE CONSTRUCTED THEORY. FOUNDATIONS OF ARITHMETIC OF REAL NUMBERS

61. First axiom system for the arithmetic of real numbers	213
62. Closer characterization of the first axiom system; its methodological advantages and didactical disadvantages	214
63. Second axiom system for the arithmetic of real numbers	217
64. Closer characterization of the second axiom system; concepts of a field and of an ordered field	218
65. Equipollence of the two axiom systems; methodological disadvantages and didactical advantages of the second system	220
Exercises	222
