CHAPTER I. Algebra of sets

§ 1. Propositional calculus 1
§ 2. Sets and operations on sets 4
§ 3. Inclusion. Empty set 7
§ 4. Laws of union, intersection, and subtraction 10
§ 5. Properties of symmetric difference 13
§ 6. The set 1, complement 18
§ 7. Constituents 20
§ 8. Applications of the algebra of sets to topology 26
§ 9. Boolean algebras 32
§ 10. Lattices 41

CHAPTER II. Axioms of set theory. Relations. Functions

§ 1. Propositional functions. Quantifiers 45
§ 2. Axioms of set theory 51
§ 3. Some simple consequences of the axioms 58
§ 4. Cartesian products. Relations 62
§ 5. Equivalence relations 66
§ 6. Functions 69
§ 7. Images and inverse images 74
§ 8. Functions consistent with a given equivalence relation. Factor Boolean algebras 78
§ 9. Order relations 80
§ 10. Relational systems, their isomorphisms and types 84

CHAPTER III. Natural numbers. Finite and infinite sets

§ 1. Natural numbers 88
§ 2. Definitions by induction 92
§ 3. The mapping J of the set $N \times N$ onto N and related mappings 96
§ 4. Finite and infinite sets 100
§ 5. König's infinity lemma 104
§ 6. Graphs. Ramsey's theorem 107

CHAPTER IV. Generalized union, intersection and cartesian product

§ 1. Generalized union and intersection 111
§ 2. Operations on infinite sequences of sets 120

Page

§ 3. Families of sets closed under given operations 126
§ 4. σ-additive and σ-multiplicative families of sets 128
§ 5. Generalized cartesian products 131
§ 6. Cartesian products of topological spaces 135
§ 7. The Tychonoff theorem 139
§ 8. Reduced direct products 142
§ 9. Inverse systems and their limits 147
§ 10. Infinite operations in lattices and in Boolean algebras 149
§ 11. Extensions of ordered sets to complete lattices 157
§ 12. Representation theory for distributive lattices 162

CHAPTER V. Theory of cardinal numbers

§ 1. Equipollence. Cardinal numbers 169
§ 2. Countable sets 174
§ 3. The hierarchy of cardinal numbers 179
§ 4. The arithmetic of cardinal numbers 182
§ 5. Inequalities between cardinal numbers. The Cantor-Bernstein theorem and its generalizations 185
§ 6. Properties of the cardinals $\mathfrak{a}$ and $\mathfrak{c}$ 193
§ 7. The generalized sum of cardinal numbers 196
§ 8. The generalized product of cardinal numbers 201

CHAPTER VI. Linearly ordered sets

§ 1. Introduction 206
§ 2. Dense, scattered, and continuous sets 210
§ 3. Order types ω, η and λ 216
§ 4. Arithmetic of order types 221
§ 5. Lexicographical ordering 224

CHAPTER VII. Well-ordered sets

§ 1. Definitions. Principle of transfinite induction 228
§ 2. Ordinal numbers 232
§ 3. Transfinite sequences 235
§ 4. Definitions by transfinite induction 239
§ 5. Ordinal arithmetic 246
§ 6. Ordinal exponentiation 252
§ 7. Expansions of ordinal numbers for an arbitrary base 255
§ 8. The well-ordering theorem 261
§ 9. Von Neumann's method of elimination of ordinal numbers 269

CHAPTER VIII. Alephs and related topics

§ 1. Ordinal numbers of power $\mathfrak{a}$ 274
§ 2. The cardinal $\aleph(\mathfrak{m})$. Hartogs' aleph 277
§ 3. Initial ordinals 279

Page

§ 4. Alephs and their arithmetic 282
§ 5. The exponentiation of alephs 287
§ 6. Equivalence of certain statements about cardinal numbers and the axiom of choice. 291
§ 7. The exponential hierarchy of cardinal numbers 297
§ 8. Miscellaneous problems of power associated with Boolean algebras . . 303

CHAPTER IX. Inaccessible cardinals. The continuum hypothesis

§ 1. Inaccessible cardinals 308
§ 2. Classification of inaccessible cardinals 314
§ 3. Measurability of cardinal numbers 315
§ 4. The non-measurability of the first inaccessible aleph 320
§ 5. The axiomatic introduction of inaccessible cardinals 326
§ 6. The continuum hypothesis 328
§ 7. η_ξ-sets 334

CHAPTER X. Introduction to the theory of analytic and projective sets

§ 1. The operation (A) 340
§ 2. The family $\boldsymbol{A}(\boldsymbol{R})$ 344
§ 3. Hausdorff operations 348
§ 4. Analytic sets 351
§ 5. Projective sets 357
§ 6. Universal functions 367
§ 7. Sieves 375
§ 8. Constituents. 381
§ 9. Universal sieve and the function t 385
§ 10. The reduction theorem and the second separation theorem 390
§ 11. The problem of projectivity for sets defined by transfinite induction . 392
