CHAPTER. I.—PHILOSOPHY AND ITS PROBLEM	1
Distinctions between science, art, religion and philosophy; enigma of the world the problem of evil; how a perfect being can create what is imperfect; Oriental solution denies the real existence of evil; the world is an illusion; Greek thought sees in the world a manifestation of divine reason; Christian thought finally explains imperfection through the procession of the Third Divine Person; religion a sort of institutional thinking; philosophy a product of the thinking of individuals, free and without obedience to authority; the contents of Hegel's great works; his logic a discussion of the genesis of the categories of the mind; why these categories must be regarded as objective laws of being, as well as subjective forms of knowing.	
CHAPTER II.—THE GREEK AND GERMAN PHILOSOPHICAL PRINCIPLES.....	22
Hegel the first to unite the Greek ontological results with the German psychological results; Aristotle's self-active Reason at the basis of Christian theology; what Plato meant by "Idea;" Fichte and Schelling give it the name of subject-objectivity; the real significance of Kant's labors; the Greek solution turns on the idea of causality; Aristotle's four causes; ancient skepticism doubts the existence of objects; modern skepticism doubts our ability to know objects as they are; ancient skepticism objective, modern subjective; nominalism the beginning of modern skepticism; Aristotle's "entelechy," and Plato's "Idea" the same as Hegel's "Begriff" or self-activity; Hegel's "Idee" what Aristotle calls a "second entelechy" and Leibnitz the "Monad of monads;" Scholasticism arose to refute Moslem pantheism; adopted Aristotle's thought; how Christianity is the germ that at length produces subjectivity, at first as skepticism in nominalism and Hume's philosophy, and next as philosophy of the absolute in Kant	

and Hegel; Kant's subjective skepticism so thoroughgoing that it refutes itself and becomes a basis for objective ontology.

CHAPTER III.—HEGEL'S EDUCATION AND THE INFLUENCE OF HIS CONTEMPORARIES UPON HIM..... 45

Early influences; discipleship of Schelling; study of Greek literature; Schelling's constructive efforts in interpreting the deep thoughts of the mystics; his insight into the substantiality of nature, which Fichte denied; nature and mind the two poles and the Absolute Reason the identity; Hegel adopts this view.

CHAPTER IV.—HEGEL'S VOYAGE OF DISCOVERY—THING, FORCE, LAW 57

When Schelling deserted his doctrine that Absolute Reason is the identity of nature and mind, and adopted the view that the absolute is an empty infinite devoid of the characteristics of mind and nature, Hegel separated from him and continued to hold the doctrine of Reason as the Absolute; the Phenomenology his first work as independent thinker; analysis of the Phenomenology; sense-certitude; Perception; how the unity and variety in things is to be explained; different hypotheses rejected and the idea of Force substituted for Thing as a more adequate conception of the reality; the dialectic of Force; each force needs another to incite it; inciting and incited forces make a system of which the internal truth is law; self-differentiation and self-identification the truth at the bottom of the ideas of force and law; self-activity, therefore, the presupposition of all being; how Schelling came to lose this insight; Spinoza's Substance compared with Hegel's Begriff.

CHAPTER V.—VOYAGE OF DISCOVERY CONTINUED—BEGRIFF OR SELF-ACTIVITY 74

Correlation of forces and the idea of law; Law presupposes self-activity; the use of the word Begriff or notion for self-activity misleading; with the insight into self-activity as the essence of the objective world, consciousness has become self-consciousness.

CHAPTER VI.—VOYAGE OF DISCOVERY CONTINUED—THE ETHICAL WORLD..... 82

Self-consciousness manifests itself in history first by life and death struggles, out of which emerges the in-

stitution of dominion and servitude; the slave takes refuge in his inner self and formulates ethical codes; out of an insight into ethics there grows a higher consciousness of the rationality of the world; the first step of insight into objective Reason is the interest in nature which observes and experiments; happiness, philanthropy, and virtue; the establishment of institutions by man Hegel treats as the realization of spirit, *i. e.* the realization of a higher self than the individual; distinction between self-consciousness, Reason, and Spirit; Spirit or the personality of the social whole utters its will in the form of ethical and social laws and customs, and requires education to prepare for it; the individual is cultured by self-estrangement, he puts off his natural impulses and puts on habits of acting and thinking according to ethical forms, customs and usages; culture enables him to see the rationality of the ethical; but at first it destroys external authority and leads to revolution; the reign of terror; reaction in mysticism.

CHAPTER VII.—VOYAGE OF DISCOVERY CONTINUED—RELIGION 103

Religion a higher activity of the soul; personal relation to the Absolute; sketch of the history of religion; evolution from nature-religion through art-religion to revealed religion or the religion that teaches that the Absolute reveals himself to his creatures and lifts them up into communion with himself; the doctrine of the Logos; God's knowing is willing or creating; the Logos creates the processio by recognizing his own derivation; Christianity reveals an absolute entirely ethical.

CHAPTER VIII.—VOYAGE OF DISCOVERY CONCLUDED—ABSOLUTE KNOWING..... 109

Since God's knowing is creating, the highest form of the human mind must be absolute knowing; defect of symbolic expression; philosophic form of knowing; the religion of a revealed God presupposes in man the power of knowing the absolute; agnosticism presupposes pantheism; it sets up an absolute devoid of attributes; revealed religion teaches a personal absolute; the nature of comprehension.

CHAPTER IX.—HEGEL'S METHOD..... 122

Hegel's method, that of tracing out the result of self-activity, which is his first principle; cause contains as

its nucleus, self activity; so does correlation of forces; the pantheistic idea of substance is the second stage of thought and inseparable from the idea of the relativity of all things; but subject is the true substance according to Hegel; the absolute is a Person.

CHAPTER X.—PURE THOUGHT—TRENDELENBURG'S OBJECTIONS..... 127

The beginning of Hegel's logic with the most elementary pure thought; this is being, and all experience is a further determination of this idea; Trendelenburg objects that Hegel names the ideas of pure thought by familiar words; two parallel lines of thought, one of deduction and the other of recognition of what is deduced as identical with the contents of experience; Trendelenburg therefore points out only an act of identifying pure thought results as the explanation of experience, but does not disprove pure thought itself.

CHAPTER XI.—THE THREE CATEGORIES OF HEGEL'S LOGIC—AN OUTLINE OF PURE THOUGHT..... 137

Being (Sein), essence (Wesen), Idea (Idee), the three great categories of Hegel's Logic; immediateness, mediation, absolute mediation; isolated independence, dependence and relativity, concrete independence and self relation; empty indeterminateness, determination through others, self-determination; mediation makes immediateness possible; the true being is self-mediated; the lower categories not adequate to express this truth; theosophy, correlation of forces; Emerson's Brahma; idea is self-activity; the Logos; the Trinity.

CHAPTER XII.—HEGEL'S ABSOLUTE AS THE TRUE BEGINNING OF HIS SYSTEM..... 146

Three beginnings to a system of philosophy; being and thought are one in God's knowing; Hegel reached the insight into self-activity as the first principle of all things before he could begin his system.

CHAPTER XIII.—ANALYSIS OF HEGEL'S BEGRIFF OR NOTION AS SELF-ACTIVITY—UNIVERSAL, PARTICULAR AND SINGULAR..... 152

Self-activity contains the phase of universality as self-determining, and that of particularity as self-determined; it is individual as a whole, or as particular elevated into universality; negative unity; the true actuality is not mere reality, but reality plus all its possibil-

ities not yet realized; Plato's "Ideas" are true actualities of this kind; Aristotle's "entelechies" the same; the relation of Hegel's thought to Aristotle's; self-activity recognized in the forms of nutrition, sensation, locomotion, thought, volition; Plato's "self-motion;" Aristotle's "active reason;" why the faculties of sense-perception and memory perish; the outcome of pure thought is the idea of God; analysis of the idea of true personal individuality; explanation of the dual categories, such as cause and effect, thing and properties, by self-relation.

CHAPTER XIV.—DETERMINATENESS AS QUALITY—BEING... 166

The simplest possible thought, that of pure being; Hegel's definition of it as utter indeterminateness and emptiness identical with pure naught; thought thinking its own form devoid of content; naught and being merely two words for the same empty idea; hence the paradox of Hegel's idea of becoming as the unity of being and naught; becoming requires difference as well as identity, and this difference Hegel fails to show; an attempt to show the real insight involved here; the true thought of pure being is self-antithesis or becoming; Plato's statement of the dialectic; the moments of the becoming are beginning and ceasing rather than being and naught, and hence becoming cancels itself and determinate being results.

CHAPTER XV.—REFLECTION ON THE METHOD OF HEGEL'S FIRST CHAPTER..... 182

Hegel's beginning (pure being) is not a first principle but the farthest removed possible from it; whatever is proved true of pure thought must be true of objective realizations of it; the categories at the beginning are annulled through their own contradictions; they have no "valid sphere;" these logical categories not God's thought, but the human process of rising to the thought of the absolute; God's thought the Trinity.

CHAPTER XVI.—THE CATEGORY OF DETERMINATE BEING OR QUALITY..... 186

Reality and negation, the two threads of determinate being; each as containing the other is a somewhat opposed to another; somewhat as the first negation of negation; Hegel's repudiation of abstract indeterminate universals; his "absolute" an individual or personal being.

CHAPTER XVII.—FINITUDE.....	192
Dependence implies finitude or relativity; quality is the form of being in which somewhat depends on the other, and the other on another; the subordinate categories of Being-in-itself and being-for-other, characteristic distinction, limit, destination, restraint and ought; why Hegel discriminates so many sub-categories in this place; outline of the dialectic process from pure being to being for-itself.	
CHAPTER XVIII.—INFINITUDE.....	202
The infinite is the union of the somewhat and the other so that the somewhat is its own other; Plato the first to discover the solution of the problem of the category of quality or finitude; self-activity solves all its conditions; infinitude is the quality of being for-itself, <i>i. e.</i> of independent being; the infinite not empty of relations but self-related; dialectic transition from dependent being to independent being; quantity.	
CHAPTER XIX.—BEING-FOR-ITSELF.....	207
Every whole a being for itself or independent; also a self-activity; how the idea of one-ness arises; negative unity; what Hegel means by "being-for-one;" one of many; each one composed of ones; quantity is an aggregate of ones, each unit being also an aggregate.	
CHAPTER XX.—THE FINITE AND THE INFINITE—A COMMENTARY ON HEGEL'S DISCUSSION OF THESE IDEAS.....	212
The "other;" "in-itself;" Hegel's order of treating the categories; finitude; agnosticism; Hegel's verbal quibbles; the ought and the restraint; destination and actual condition; the "ought" implies a synthesis of somewhat and other or the infinite; ideality a very important category; the erratum in Hegel's text— <i>Identität</i> for <i>ideelität</i> .	
CHAPTER XXI.—BEING FOR ITSELF—A COMMENTARY ON HEGEL'S DISCUSSION.....	228
The dialectic of being is a progression from being and naught as the extremes of a dualism to the insight which sees the negative to be only the activity of self-determination; being-for-one; ideality of the qualitative moments; explanation of six moments that constitute the idea of the One according to Hegel; why these six moments appear as independent and coördinate; they constitute an analysis of self-activity; the atom	

and the void; Hegel's use of the terms repulsion and attraction misleading; divisibility essential to quantity.

CHAPTER XXII.—QUANTITY..... 242

Schelling's dictum, all determination is quantitative; in what sense it is true; review of the dialectical progress from being to quantity; the sub-categories of quantity; tautological definitions of quantity; the contents of Hegel's fourteen extensive notes on quantity; full discussion of his note on the Kantian antinomy of the limitation of the world in time and space; Kant's antinomy rather that of infinitude of space than of the world in space; not a real antinomy after all, for its thesis and antithesis presuppose the same thought.

CHAPTER XXIII.—THE RELATION OF QUANTITY TO QUALITY
ELUCIDATED..... 257

Quantity the union of attraction and repulsion in the sense that Hegel uses these terms; attraction the predominance of ideality, and repulsion the predominance of "reflection-into-itself;" quantity is self-determination with the self left out; the dialectic that leads out of quality to quantity really leads to the absolute idea at once—from the finite to the infinite, as Plato and Aristotle saw; Hegel takes next the most immediate phase of self-determined being and finds it to be quantity; three points of view in which Hegel treats each category; what "indifference" means with Hegel; nominalism and realism; the general name stands for the determining process, and not for the particular individual nor for the abstract class; the true actuality is this determining process; the deeper meaning of quantity as the most abstract concept of subject-objectivity or self-consciousness; the Logos thinks the processio as beginning with empty space and time; quantity the form of self-determination without the substance of it; continuity and discreteness; sum and unity; arithmetical processes explained; extensive and intensive quantity; dialectic of the transition from extensive to intensive quantity seemingly a verbal quibble; the real thought underlying it, not stated by Hegel.

CHAPTER XXIV.—QUANTITATIVE RATIO AND THE HIGHER
MATHEMATICAL ANALYSIS 275

The differences between Hegel's two expositions of quantity—the large logic compared with the small

logic of the Encyclopædia; quantitative ratio the highest form of quantity; constituent units, sum of these units and including unity the three moments of quantity; the limit of extensive quantity the sum, but the constituent units the limit of degree; hence degree is qualitative unity; Hegel ought to have placed intensive before extensive quantity; maxima and minima; quantitative ratio; ratio of powers; measure.

CHAPTER XXV.—MEASURE 281

Measure the union of quantity and quality in such manner that the increase or decrease of quantity changes the quality; Hegel's logical procedure ascends and draws up the ladder after it; not pure being but absolute personality is the basis; measure expresses better than quality or quantity what the latter are intended to express; Darwin's idea of evolution by survival of the fittest, by reaction against environment, has revolutionized natural science; the moments of measure are quantitative ratios; these moments must also be measures, and hence a series of measures arises; how measure develops its contradiction, and the measureless results; résumé of the entire dialectic of Being.

CHAPTER XXVI.—ESSENCE..... 296

Essence is the idea of universal relativity; everything entirely dependent on something else; everything a phenomenon; Hegel writes this logic from the standpoint of the Absolute Idea; pantheistic religions assume essence as the highest principle; essence the formless absolute; Brahma; pure being *versus* essence; the twelve *Nidanas* of Buddhism; the dialectical origin of essence; the sub-categories of essence; the changes made by Hegel in their order in the Encyclopædia; the changes concern the words that name the successive thoughts rather than the thoughts themselves.

CHAPTER XXVII.—REFLECTION AS THE KEY TO HEGEL'S DIALECTIC..... 309

Appearance and reflection-into-itself; the dialectic a process of finding presuppositions; categories of essence negative and the source of skepticism; Reflection as positing, as external, and as determining; its treatment in the small logic; return-to-self or self-relation the form of being; the positing reflection; its subtlety; Hegel's great merit that he gains a complete

insight into the movement of reflection; his forerunners; the difference between positing and presupposing reflection; external reflection separates positing from presupposing reflection; "plain common sense" uses this point of view; how reflection-into-self produces identity and difference; determining reflection; how it arises from the dialectic of external reflection; résumé of this subtle discussion which is the key to Hegel's entire logic.

CHAPTER XXVIII.—THE CATEGORY OF CAUSALITY..... 329

Identity, difference, contrariety, contradiction; Hegel's confused way of speaking of contradiction and the excluded middle; ground or substrate; form and content; condition and conditioned; exposition in the small logic; phenomenon; thing and force; actuality as the union of the internal and external; necessity the union of possibility and reality; the essence of the causal relation is self-activity; necessity or fate; reciprocal action; *causa sui*; self activity is the presupposition of essence.

CHAPTER XXIX.—THE FORMAL LOGIC NOTION AND JUDGMENT..... 349

The third volume of the logic treats of self-activity or *Begriff*; this is the ego; the notion as universal, particular and singular; judgments of determinate being, of reflection, of necessity, of the notion; (1) positive, (2) negative, (3) infinite; (1) singular, (2) particular, (3) universal; (1) categorical, (2) hypothetical, (3) disjunctive; (1) assertorical, (2) problematic, (3) apodictic; Rosenkranz's classification.

CHAPTER XXX.—FORMAL LOGIC CONTINUED—THE SYLLOGISM..... 360

Deduction of the syllogistic figures; the major premise of the first figure proved by the third figure, and the minor premise by the second figure; the syllogisms of reflection express the quantity of mediation; the syllogisms of necessity express the totality of determination or self-determination; the syllogism as clew to the psychological process of sense-perception; it begins with the second figure, recognizing the class of the object; uses next the first figure suggesting what is previously known of the class for verification in the object before us; the third figure forms general terms; it subdivides more abstract and vague classes by adding new charac-

teristics which further determine the single general class into new sub-classes; the syllogism is the form of all self-activity.

CHAPTER XXXI.—OBJECTIVITY.....

378

The subject is its own object in self-activity; Platonic thought of the Logos the clew to Hegel's doctrine of objectivity; St. Athanasius and contemporaries on the relation of the Logos to creation of the world; the processio; Dante and St. Thomas on the processio; Hegel's mistake of the processio for the Logos; St. Anselm's proof of the existence of God; the totality as both objective and subjective; we cannot have an idea without thinking it in relation to its complement, the residue of being, and the total of these two or the absolute; mechanism as the lowest form of objectivity; explained as the duality of self-determination with its unity omitted; space and time; gravitation and revolution about a centre the first appearance of the unity implied; chemism, as meaning the mutual relation of contrasted elements, reveals the unity in the form of blind affinity; but teleology reveals the unity as purpose or end, as ideal totality.

CHAPTER XXXII.—THE IDEA AS PERSONALITY.....

390

The objective that is also subjective is living individual being—plants, animals, men; the union of subjectivity and objectivity in the individual is called idea by Hegel; its lowest, immediate, form is life; its higher form is will and intellect; the union of intellect and will so that self-knowing is the creation of another (the Logos) gives us the absolute Idea, the final goal of this logic of pure thought; principle, method and system; definition, classification, theorem; the formal discussion of exposition misleads Hegel's disciples as to the nature of his absolute; quotations showing that his absolute is personal being—"free subjective self-activity possessing personality;" the relation of the Absolute Idea to nature; goodness loves to participate or share with others; hence creation; the absolute gives existence and freedom to its other in the form of nature; nature a process of evolution of spirit; particular spirits unite in the Invisible Church, and the spirit of the whole is the absolute personality of the absolute institution; criticism on Hegel's view of nature as the Logos rather than as the processio of the Spirit; why the dialectic stops with the absolute

Idea and does not lead also to nature; it stops because the Idea is its own other, perfect subject and perfect object; in nature there is neither perfect object nor perfect subject to be found; hence there can be no fatalism in this theory, although it involves logical necessity; fatalism is ontological necessity or external necessity; the necessity of the absolute to be a person and subject-object is only a logical necessity; the method of the Absolute Idea to impart its being through grace to new individuals unceasingly created, who, though they begin to be, yet never cease to be, but are immortal.
