CHAPTER	PAGE
INTRODUCTION	I
Departure from experiences with man • Biology as a science of living beings • Departure from pathological data	
I. METHOD OF DETERMINING SYMPTOMS. CERTAIN GENERAL LAWS OF ORGANISMIC LIFE. OBSERVATIONS ON PERSONS WITH BRAIN INJURIES	15
THE PROBLEM OF DETERMINATION OF SYMPTOMS.....	17
Three methodological postulates	
DISINTEGRATION OF PERFORMANCES AND THE HIERARCHY WITHIN THE ORGANISM	28
CHARACTERIZATION OF PERFORMANCES ACCORDING TO THEIR FUNCTIONAL SIGNIFICANCE OR VALUE AND THEIR SURVIVAL IMPORTANCE	34
CERTAIN GENERAL RULES DETERMINING ORGANISMIC LIFE	35
Normal ('ordered') behavior and 'disordered' behavior. Catastrophic reaction • Tendency to ordered behavior • Lack of self-perception of defects. Tendency to exclusion of defects • Modification of preserved performances and of milieu in a defect • Cortical lesions. Avoidance of catastrophic situations • Substitute performances. Tendency to hold to the preserved performance level • Tendency to undisturbed state • Tendency to orderliness • Anxiety and avoidance of 'emptiness' • Relative maintenance of ordered behavior by shrinkage of milieu according to defect • Tendency to optimal performance: Hemianopsia and formation of complete visual field. The adjustmental shifts • Further illustrations of the tendency to optimal performance: Hemianblyopia; Adaptation to a defect without shift • Monocular diplopia. Adaptation to a defect in order to preserve optimal performance • Modification and preservation of performances. The rules of adjustmental shift in defects • Energy and performance • Reference of symptoms and performances to the whole of the organism. Is the organism a whole, and if so, how can we recognize it as such?

II. THE ORGANISM VIEWED IN THE LIGHT OF RESULTS OBTAINED THROUGH ATOMISTIC METHOD. THE THEORY OF REFLEX-STRUCTURE OF THE ORGANISM	67
THE OBSERVABLE PHENOMENA DO NOT CORRESPOND TO THE DEFINITION OF REFLEXES	68
Individually disparate mechanisms as alleged constituents of behavior • The facts: No constancy • Variation of reflexes according to the receptive field and kinds of stimuli • Variations according to harmless and harmful stimuli • Variations according to stimulus-intensity • Variations according to postural factors. The so-called "reflex reversal" • Reflexes and total condition • Variation according to humoral condition. Vagus and sympathetic • Drugs and hormones • General interaction. Reflex and retro-action of periphery upon nervous center, and vice versa	
CRITIQUE OF REFLEX CONCEPT	79
The so-called inhibition, shunting, etc. • The reversability of all reactions; exemplification by the phenomena of tonus • The so-called reciprocity and self-regulatory cycle of processes	
FROM WHENCE COMES THE DIRECTION IN THE ACTIVITY OF THE ORGANISM?	87
From without? • Criticism of the purely environmental theory. World and environment (milieu) • Sherrington's concept of integration • Is the direction issuing from the organism itself? The theory of co-ordination centers • The "resonance" theory of Weiss • The theorem of Uexkuell • Bethe's principle of gliding coupling • The elements posited by the reflex theorem cannot offer an understanding of the organism	
III. THEORETICAL REFLECTIONS ON THE FUNCTION OF THE NERVOUS SYSTEM AS FOUNDATION FOR A THEORY OF THE ORGANISM	103
THE NERVOUS SYSTEM A NETWORK. THE COURSE OF EXCITATION IN SUCH A SYSTEM	103
Distribution of excitation through the spatial and functional 'near-effect.' • The significance of adequate anatomical structures • The processes in the 'distant part.' Figure-ground formation • The distribution of excitation depends upon the condition of the organism as a whole • The distribution of excitation depends upon the condition of the organism at the onset of a reaction	

THE EQUALIZATION BELONGS TO THE EXCITATION-COURSE . .	113
Equalization towards an 'adequate' average level in an 'adequate' time; a basic biological law • The equalization process and the milieu of the organism. The catastrophic reaction • Distribution of excitation corresponding to the "all or none law"	
DISCUSSION OF THE PHYSICO-CHEMICAL AND SO-CALLED PHYSIOLOGICAL FACTS	121
The compatibility of our theory with the anatomical facts	
IV. MODIFICATION OF FUNCTION DUE TO IMPAIRMENT OF THE ORGANISM	131
THE 'DEDIFFERENTIATION' OF FUNCTIONING IN THE IMPAIRED SUBSTRATE	131
Impediment and retardation of the excitation process. Defective equalization. Abnormal stimulus-bond. 'De-differentiation' toward greater homogeneity • The effect of isolation	
DEDIFFERENTIATION EXEMPLIFIED BY PHENOMENA OF LESIONS IN VARIOUS PARTS OF THE NERVOUS SYSTEM	134
Symptoms of isolation in the spinal cord • Explanation of the Babinski phenomenon as the effect of dedifferentiation of motor-performance. The nature of flexion- and extension-performances • Other phenomena in plantar stimulation due to isolation by disease • Abnormal excitation-spread under isolation • The alternating reactions. Rigidity and lability in the figure-ground process as expression of isolation of an apparatus • Alternating process and rhythmic performances • Symptoms of isolation in the cerebellum • Symptoms of isolation in the cerebral cortex • Abnormal distractibility and abnormal stimulus-bond as expression of defective figure-ground events	
V. THE NATURE OF PARTITIVE PROCESSES	157
WHAT IS A REFLEX?	157
The reflex as expression of experimentally produced injury • The individual reflexes as sequelae of different forms of isolation	
THE MEANING OF THE REFLEXES	161
Proprioceptive reflexes as the expression of equalization—the most primitive type of reaction • Proprioceptive reflexes as expression of reactions in border situations • The meaning of proprioceptive reflexes • Exteroceptive reflexes are performances, not reflexes • Reflex and

CHAPTER

equalization process as the simplest reaction of living substance to stimuli • The "higher" organism exhibits more reflex phenomena than the lower • The question of reflexes within the continuation of a performance	
METHODOLOGICAL CONCLUSIONS	173
The diagnostic significance of the reflex • Significance of reflex investigations for the understanding of performances • Only theories working with 'positive factors' are acceptable	
THE CONDITIONED REFLEX	175
Criteria and characteristics • Significance of conditioned reflexes in man	
THE PHENOMENA IN CORTICAL STIMULATION	180
THE SO-CALLED INSTINCTS	183
Characteristics and criteria. Variability and end-effect • Instinct, equalization-process and turning-to reaction • "Instinct-action" and experience • "Instinct-actions" inseparable from the whole • Transitoriness of "instinct" in relation to the whole	
THE SO-CALLED DRIVES	194
Drives as release of tension—a pathological phenomenon • The "drive for self-preservation"—a pathological phenomenon • Only one drive: self-actualization • Discharge of special tension—a phenomenon of defective centering • Potentialities ('capacities') and self-actualization. Tendency to perfection • Drives, capacities, and habits	
THE SO-CALLED CHEMICAL PARTS	207
VI. ON THE CONCEPTION OF THE ORGANISM AS A WHOLE	213
THE PHENOMENA IN INDIVIDUAL PARTS OF THE ORGANISM AND THE EVENTS IN THE REST OF THE ORGANISM	213
Any change in one locality is accompanied by a change in other localities • Homologous and heterologous changes in different fields	
THE RELATIONSHIP OF EVERY INDIVIDUAL REACTION TO THE ORGANISM AS A WHOLE	217
The stimulus effect is determined by the 'functional significance' of the stimulus for the organism. The so-called nociform reflexes • The various phenomena in different fields form a unitary whole • Impediment in one part of a reaction disturbs its total course • Meaningful modifica-	

tions in cases of impediment: the righting reflex in the starfish; the wiping reflex in the frog; scratching in man • Only one performance is possible at the same time. Exemplification by reflex phenomena • Exemplification by the medusa; by mental processes in man • Every reaction is a "Gestalt-reaction" of the whole in the form of a figure-ground configuration • When do processes appear in a part of the organism?

THE RELATIVE INDEPENDENCE OF THE PERFORMANCES FROM THE FUNCTIONING OF A SPECIFIC LOCALITY TO WHICH "NORMALLY" THEY ARE RELATED—THE HOLISTIC RELATIONSHIP OF PERFORMANCES. EXEMPLIFICATIONS 226

Transplantation of nerves and muscles • The adjustmental shift requires no training of innervation and no preformed histological connections • The sequellae of amputation • The adjustmental shift in hemiplegia • Writing with the left hand without training: a further proof of holistic relation • The shift is facilitated when a performance becomes entirely impaired • Dependence of substitute phenomena in cortical impairment upon the whole

LOCALIZATION AND SPECIFICITY 249

The significance of anatomical structure in the brain cortex • What is the meaning of differentiation? • Localization of mental phenomena • Criticism of the localization theory on a symptomatological basis • The so-called specificity of the senses • The so-called specificity of the vegetative system

THE SO-CALLED ANTAGONISM 271

"Antagonistic innervation" of voluntary muscles • Our holistic interpretation of the so-called antagonism • "Antagonistic innervation" of vagus and sympathetic • Organismic behavior under 'opposed' simultaneous stimuli • The rhythmic excitation course—basic to the "coming to terms" of organism and world

VII. CERTAIN ESSENTIAL CHARACTERISTICS OF THE ORGANISM IN THE LIGHT OF THE HOLISTIC APPROACH 291

ON THE PHENOMENON OF ANXIETY 291

Fear and anxiety. Anxiety has no "object." The basis of fear is threat of the onset of anxiety • Anxiety in infants and animals. The "uncanny." "Instinct-fear" and "experience-fear" as the results of critical inadequacy of the organism to stimuli • The significance of anxiety for conquest of the world and for self-realization

CONTENTS

CHAPTER	xix PAGE
<p>THE SO-CALLED UNCONSCIOUS AND CONSCIOUSNESS</p> <p>Psychoanalysis and biology • The "unconscious." Three behavioral aspects • The configurational relation of the three behavioral aspects: performances (conscious behavior), attitudes (inner states), and processes (somatic events) • The problem of "after-effect." No "invasion of the unconscious." After-effects of each behavioral aspect are only actualized in the original aspect • Forgetting and so-called repression in childhood • Continual formation of new patterns render ineffective former attitudes • The so-called unconscious in neurosis • Ambivalence and neurosis • The pleasure principle. The death instinct: erroneous hypostazations of tension and release under isolation. The rôle of consciousness</p>	307
<p>THE ORGANISMIC UNITY OF "BODY" AND "MIND"</p> <p>The psychophysical problem. No independent realm of "body" or "mind." No supremacy of "body" or "mind" • The "psychological" and the "physical" are indifferent to the real processes. The "functional" significance for the whole is alone relevant</p>	335
<p>THE CONSTANTS. PREFERRED AND ORDERED BEHAVIOR</p> <p>The "preferred" behavior • The characteristics of preferred behavior and its explanation • Ordered behavior and preferred behavior • Preferred behavior, as ordered behavior, pertains to the whole organism • Two types of constants—as to species and to the individual</p>	340
<p>VIII. ON GESTALT PSYCHOLOGY AND THE THEORY OF THE PHYSICAL GESTALTEN</p>	369
<p>PREFERRED BEHAVIOR AND GESTALT</p> <p>Good Gestalt as a definite form of coming to terms of the organism with the world • Stability and reality • Simplicity and minimal expenditure of energy in good Gestalten</p>	371
<p>THE THEORY OF PHYSICAL GESTALTEN</p> <p>The problem of topography in Gestalt theory • Summary of the two holistic notions</p>	380
<p>THE PROBLEM OF PARTS AND WHOLE</p>	393
<p>IX. THE NATURE OF BIOLOGICAL KNOWLEDGE</p>	399
<p>CHARACTERIZATION OF THE NATURE OF BIOLOGICAL KNOWLEDGE</p> <p>"Analytic" and "Synthetic" approach • The concept of adequacy and reality • The principle of exactness</p>	399

CHAPTER	PAGE
THE EPISTEMOLOGICAL RELATIONSHIP BETWEEN BIOLOGICAL AND NATURAL SCIENCE	410
<p style="margin-left: 40px;">Symbolic character of knowledge in general • Incompleteness of biological knowledge and the a-causality in cognition of natural science • Entelechy and "reason in knowledge" • Whole and "members" • So-called purposiveness</p>	
X. ON NORM, HEALTH AND DISEASE. ON ANOMALY, HEREDITY, AND BREEDING	427
ON THE DETERMINATION OF NORMALITY	427
<p style="margin-left: 40px;">Health and disease • Disease not determinable as to contents, nor as deviation from a superindividual norm • Definition of disease presupposes a conception of the individual nature • Disease as "defective responsiveness" • The restoration of health • Summary of our concept of disease and health • The two types of adaptation to a defect • The tendency towards preservation as expression of decadence of life</p>	
BIOLOGICAL KNOWLEDGE AND ACTION	447
ON ANOMALY AND SPECIES	450
HEREDITY AND BREEDING	457
XI. ON LIFE AND MIND. THE PROBLEM OF ORGANISMIC HIERARCHY	465
THE SO-CALLED ANTAGONISM BETWEEN LIFE AND MIND ...	465
<p style="margin-left: 40px;">The so-called vital sphere and the life process as a whole • Biology and ontology</p>	
THE HIERARCHIC STRUCTURE OF LIFE	479
<p style="margin-left: 40px;">The problem of adequate criteria • The differential functional significance of flexor and extensor movements • No criteria of hierarchy according to organs or organ systems • The problem of 'centering and richness' • Centering and richness of the apprehended world as criteria for the level of organization • Phylogeny and ontogeny</p>	
XII. KNOWLEDGE AND ACTION	497
BIOLOGY AND ACTION	497
ACTION IN TECHNOLOGY AND EDUCATION	500
<p style="margin-left: 40px;">Practice and drill</p>	
CONCLUDING REMARKS	505
INDEX	521
